it is an honor to see my old codings running on a brand new machine :)

Do you want me to send you a film showing Quake 1 running at full speed
on an 'emulator' as you said ? You just faint to press on the forward
button, and quake explore the full land of the game in one shot !

I'm alway interested in VM because it prefigures real platforms.

I'm pleased to hear that :)

Then will you own a PlayStation3, because it will run a large
variety of ATARI games ! If you won't, you're in the wrong
ATARI perspective ... I'm sorry.

And so, what will be the link between ATARI classics and PS3 ?
Isn't a VM like ARAnyM the best candidate ?

You'll have to make up your mind ;)

7813. Cubase or Pro24 under emulation??

Newsgroup: comp.sys.atari.st
Date: 2006-09-09 19:44:50 UTC
From: 100550.3170@compuserve.com
Message-ID: <450c1826.2624980562@news.freeuk.net>
Source record: 7490

Hi

I have had to dig out my 1040stf 4mb to load up my old Steinberg Pro24 prog so as to see how to best setup a more modern system on a less than modern IBM Thinkpad 760ED (133Mz, 104Mb, 5Mb hdd 2mb video ram) that actually has a dedicted Midi import, albeit needing the midi to serial cables.

In fact assuming that this wouldn't give me full Midi, I went and bought a Paralell Midi interface for a PC off eBay - a Midiman Portman, but the bugger needs a fully connected (25pins) Centronics cable and a standard printer cable won't do... B'locks!

So another thought was anyway to run Pro24 or Cbase under any of the PC ST emulators? The laptop runs either W95 or W98se depending which drive I insert...?

Really, I want to explore VST now and don't think thats possible on olde ST's !!

Any thoughts/experiences anyone??

Cheers

Oh i didnt know u are THE developer. I am sure coders look on the issue
diferently. So forgive me... I still miss the connection between your code
and brand new machine, can u elighteen me:

Is it your code so clever, or it runs on brand new machine because new
machine is using an emulator? I dont understand much about coding so im
asking for nice and plain answer.

Thanks for bringing some facts into this debate :-). I had no idea that
the PCBs would run that expensive; I foolishly figured that given (say)
a run of 50, they could be had for around $5 a piece. At those prices,
it's around $40 for parts without any labour, so no wonder the prices
are as they are.

My apologies to any and all Atari hardware manufacturers, and my sincere
thanks for continuing to provide us with stuff :-).

Roger

Hi Roger,

Oh it's only expensive in small runs. I do have an admission to make about PeST, in the newer smaller size wasn't just for the customer's benefit. It was also to squeeze as many PeSTs onto the boards. They work out at about £2 ea.

The problem with ALOT of the cheapo PCB prices quoted is that they're for the most basic single sided boards, with no silk screen or vias. And once you start getting quotes the figures go up a ridiculous amount.

Things are helped at the moment with the weak dollar either. My USA PeST orders have gone down alot since we've been looking at £1=$2. A guy in the States emailed me a few weeks ago asking if I'd sell in bulk for $8 each which is about £4. It doesn't even cover the cost of a PCB and the chip alone.

Not sure when the $ is going to balance out. I wonder here if we're on the brink of recession being hidden by all of the credit borrowing going on. In the late 80's the £ was worth about $2 when recession hit.

Waffle waffle ;-)

I will explain a little, so that you won't miss something ...

You live in Pandora don't you ? I live in Paris ! The distance may make things hard to share ... But we share a bit of an ATARI enthusiasm.

Then, one time you were surprised that Pandora Radio was existing. It works on every platform here, except my Hades 60, my Falcon 30 etc. How to follow one's ATARI enthusiasm without omitting other great passions, like listening to music ? For instance ...

My answer was to give a hand to Unix hosted ATARI emulators first, then ATARI GPL VM after that. I can now follow my two passions.

You will admit that music is part of the ATARI gift to computer world.

Would you obliterate everyone's dream because you are fund of your old classic hardware ? If there was another simple way ?

Don't be so exclusive in your passions. Let people share it with you.

You're welcome.

Best ATARIan regards,

Please, please, please, pretty please... I urge anyone not to take
Franï¿œois Le Coat as some kind of marketing drone working for the ARAnyM
project. He just works for himself, whatever that may mean. As far as
I'm concerned, I consider him more of a liability to ARAnyM than
anything else, because in part of the gibberish he posts here and
everywhere he goes and his insulting and self-righteous attitude.

JFL

Both those programmes use a software copy-protection dongle that plugs into the side of your ST. Where are you going to put that if you use an emulator ? Sadly this problem has never been addressed by the writers of emulators, and I don't expect there's anyway you will ever be able to do.

Some of the best Atari software needs these dongles, but the only answer is to use your Atari.

(Or persuade someone to make you a PCI card to plug the donlge into, and write the drivers for it....)

Cheers

Paul

Well ... I was speaking about an example about the music and Pandora
Radio ... But can you develop an ATARI application at the same time
as phoning to another ATARI developer on the computer you're using ?
That's what I can do with <http://www.skype.com/> that doesn't run
on ATARI classic hardware.

That's without speaking about the great amount of games that are
not present on classic hardware, apart from Quake, and that will
be present on the PS3 ... And gaming is 90% of the IT market !

You may say that I'm off-topic ... I much prefer to say that there's
no so naughty dumb man than the person that doesn't want to understand !

ARAnyM is a *big* progress for the ATARI community. I read an acrimonious WEB page that you dedicated to this VM. I fully know your opinion about it.

Will you tell me that you make up your mind about it ?

Hi,

You may be interested by the following uptodate snapshots of
ARAnyM. Very latest devels have been taken into account.

- The Pack_3D at <http://ebmodel3.atari.org/Pack_3D/> that works
on 3 OS/platforms including Windows, Linux and MacOSX.

It includes ARAnyM 0.9.4alpha and

EmuTOS dated from 2006/02/20
FreeMiNT+XaAES from 2006/02/20
TERADESK 3.84
EB MODEL3 3.62a version (only available in this pack)
EB_DUMP 0.9.7
EUREKA 2.12 beta from 2006/09/09 (only available in this pack)
QED 5.0.5
POV 3.1g
ZVIEW beta 7
ZTASK 1.0
MESA_GL 0.93 version (derived from Mesa3D 2.6)
CAB 1.5
HIGHWIRE 0.3.0
HYP_VIEW 0.35.2e version
PAULANG 0.2b

ready to start with.

- The minimum pack at <http://eureka.atari.org/MacAranym.zip>
that is built for MacOSX.

Enjoy :)

Cheers Michael,

Actually that's pretty cool - I get to define how I want the card to
behave, and can develop with it in-place without having to have the
thing work immediately :-)

Thanks a lot :-)

How the hell is music passion related to ATARI? If i have passio for music (i do) i will built myself BETTER sound system as some computer (ANY) and enjoy the music. This has only link to snobism, aka my computer can do this and your can not. When u will get into your head that being a FAN of some machine is being a fan of its hardware too? If u stick a "wv beetle" sticker on your Mustang or Mercedes u will NOT impress any WV Beetle fan!

> Would you obliterate everyone's dream because you are fund of your

> you.

This is biggest nonsese i ever heard in this group! Because we are Atari machines fans, we obliterate everyone's dreams? First: your "DREAMS" seems to be yours alone, not everyones. Second: If i dont use and like Aranym i dont obliterate anyone's dreams. Everyone is welcome to use anything they like, just dont mess with us how oldfashion and destructive we are... Third: u should share your passion, be as quick on code as you are in mouth and PRODUCE skype apps for ATARI, Pandora radio stream app for ATARI and any one example u want to use... Aranym is "oh so beautiful and powerfull emulator", but u still use apps designed for ours crap boxes. Aranym is step forward exactly 0 meters, as apps u dream about do NOT exist, so anyone, including you use HOSTS application (PC, MAC). Thats exactly what this thread started about. So make those apps so ppl will be able to USE stuff u dream about in reality, not in dreams only... After all, u are THE developer!

Yes, and he miss the MAIN point. He is so busy with promoting Aranym and playing with our heads and emotions to gain his goal, that he missed the fact that noone of the applications like Skype, etc etc actualy exist for Atari, and thus for emulators as well. So what good Aranym will do then? And what good to Aranym will he do, by calling every Atari machines fan old fashion, obliterators of other ppls dreams and such? Not much, it effectively stopped me to think again about using it. We had such stuff early in Aranym days as well.. Things did look better, until now...

Janez

Emulators DO depends on software developed for original machines.. Its as simple as that...

Something along those lines:

"Hey, for a really powerful "atari machine", buy a PS3 and install Aranym on
it."

As that can be done already with a stock PC, I fail to see FLC's point. I
think he hopes the powerful Cell processor will be put to profit into the
emulator (or anything else). But using the cell to its full potential will be
very difficult and not applicable to every single program in existence
because of its highly "parallelizable" nature. I think that's what the OP
seems to ignore (or doesn't want to hear).

When one speaking about parallels 'SPE' present in the 'Cell' processor,
we just make assumption that this highly parallel system is a sort of
simple 'Altivec' glue, around a 'PPC G5'-like conventional processor.

I definitely assure you that we're not speaking about a regular
parallel architecture, but rather about a very efficient super
"Power PC" evolution.

I wouldn't go so far ...

First, Linux is *installed* on a regular PlayStation3 shipped package.
That's the native OS of the system. Latest Linux kernels support it.

Second, IBM is distributing free the devel system that makes it,
from a developer point of view. To make your mind about it, then
read <http://www.macworld.co.uk/news/index.cfm?RSS&NewsID=13100>

We're just about to make it true, and you're kidding again ;)

Would you accept that I tell you friendly.

Sony is Japanese. IBM is Korean. ATARI is French.

Do you really think that you're leading the ATARI world from
your little town of Pandora, United States ?

Would you change living in Cupertino, or better Eureka, California.
I think that these are much better place to live at really !

ATARI rules :)

Hi MG!

Just Atari.

I have VST 3.7r2 for PC. Well, it's O.K. I have used it with Windows95.

But, the Timing on the Atari sounds better. (and a more stable computer operating environment, in short: it crashes fewer! For the technical part... the musical side is known and hearable)

(using an emulator to drive hardware via the PC is out of my imaginaton. Why should someone do that!? Better take the emulator (PC DOS/Win) itself ;-))

Best Regards,

Daniel Mandic

P.S.: You must have a Dongle. Cracked Versions are not satisfying... maybe for checking purposes (hardware etc..), but not for adequate work.

ST runs all Cubase Version (min. 1-2MB, 4MB recommended).
The 32bitRAM machines are running Cubase only with the higher versions.

E.g. Cubase Audio -the last Atari cubase for the 32bit Falcon, but should run fine on a TT, too. Without the Audio features, of course.
But who needs that :).
Or Cubase Score II for example! Also one of the latest.

Hi,

I have updated again my PCI story with 2 new photos, and Kronos in
16M...

http://perso.orange.fr/didierm/ct60/ctpci-e.htm

Desktop now works in 1280 x 1024 x 16M colors.
You can see than emulation (here the cf68klib) isn't a solution, after
rewrited some fVDI asm text files, now it's until 10 times faster in
native code. Look at display text results.

Sources and TOS are also updated and online:

http://perso.orange.fr/files/firetos.lzh.

To be continued...

Regards,

Didier

Excellent, can't wait to get CTPCI/Radeon working on my Falcon here :)
Keep up the good work.

Ok, from what I read so far I think Francois wants to say is that he
is dreaming that he'll do everything with his Ataris (Skype, Pandora,
etc.), and aranym on a mac is giving him a chance to do all that with
one machine. Now, his ultimate goal will be to do that on a real
atari, but until then he uses this cofiguration.

(correct me if I'm wrong Francois)

In that fashion I don't blame him too much. I'd love to throw my pc in
the wastebin and do everything with my falcy+ct63. But until I achieve
that I'll keep using my pc as an internet box.

Try using the control panel on the ST to change the serial port speed.
Try 19200/8bits/no parity. Then press the according f-key on the pc
client. This should work. Also, try 9600 if this fails.

hope this helps,

Hi I have a question about ARANYM for anyone on here that uses it. I have a Intel Imac and an old IMac G3. I like to run emulators on both. I like the concept from what Ive read about ARANYM but I dont quite understand, will it run ST games as well as apps? Basically it's important to me that Llamatron will run on my mac.

Aranym is not the thing for you then. You should look around for a mac
ST emulator, like noSTalgia or hatari.

The question that is posed is quite special.

If I get the following Falcon30 Llamasoft game :

<http://www.llamasoft.co.uk/downloads/softography/falcon/llamazap-falcon.zip>

That I unzip it in <http://eureka.atari.org/MacAranym.zip>, that I
boot with TOS4.04 rather than EmuTOS, and that I inactivate fVDI.

If I launch the game, there's no sound, and the game's intro
display correctly, but you can't play with it, and the game's
levels are not displayed correctly. This game is special, because
I think that it requires an analogical ATARI gamepad that I
don't have, though I own a basic Falcon30 hardware.

But in the same conditions, and performing the same precautions
with MacAranym, Quake will work fluently, with the game's sound,
and it can be played totally.

The explanation is that Quake is written for Falcon060, that is
a sort of customized hardware. I know that perfectly because my
devel machine is a Hades60 from Medusa, Switzerland. So that the
author from Quake's port had a very close care to build portable
binary code. Often, 060 code on 060 machines run the most portable
ATARI machines code. Mostly because it is clean, as would developers
say ... I develop programs on my Hades60 since June 1996 !

My answer would be that most of recent ATARI games will run on
adequate machines. But it is rather rare ... The good thing to
ask is not 'could I play that game that I beloved' ? But rather
'what are the good games' ? Not for interest for the game, but

rather for technical reasons ...

How far all these games are cleanly written ?

Quake is !!!! Would you like playing Quake ?

I hope it'll help.

Best regards,

Why Quake?

Bez of the Hardware requirements :). 68060 etc.

How about DOOM releases?
I liked to play DOOM I and II on various Intel CPU's.

Although, pixel-art graphic Games on ST or Amiga are my favourites.
TV-like.... and that of the eightbitties too, of course!

Kind Regards,

Daniel Mandic

I don't know, actually it's impossible to use FPU, I got line F.
The cf68klib not emulates unimplemented FPU instructions, and on the
Coldfire, like integers, the core use variable length decoding
instruction between 1 and 3 words. So some complex adressing modes not
works, but the main problem is fmovem like movem. For example
fmovem fp0-fp1,-(sp) need a replacement by
lea -16(sp),sp
fmovemm fp0-fp1,(sp)

Regards,

Didier.

If it can help, I have the working assembly code suitable for PURE C
devel tools, of the 68060 FPU emulator originating from Motorola WEB
site ... I don't know if it is still available, and useful in that
case.

I got sources, adapted it to PURE C assembly syntax, tested it
extensively with my Eureka software, Persistence Of Vision and
other numerous softwares that require Floating Point Unit usage on
my Hades 60, since all these years !

If that sort of assembly code could be used and patched, so that it
translates 68k to ColdFire compatible code at run time, don't
hesitate to ask it from me.

I would be so happy to help you in that matter. I'm so concerned
with the support of the FPU assembly code, on every ATARI platforms
I met in my computers development experience.

Best regards,

> 70$ US ? ! The price is expensive for a such small hardware ...
>
>

Its becasue of low demand, If someone now asked you to build a Afterburner, you did not have PCB layouts, or parts, had to design new pcb, build test, all your time, self assembly... it all soon adds up... if someone paid an enginner time to design pcb and produce, It would be around $300 to produce.. for just 2 hours work and PCBs.

During PeST we would never get back the cost of our time, 2 weeks debugging for PeST, 80 hours normal working week, enginner £100 per hour, £100x 80hours - £8,000, this is before time in development.. We should be selling PeST for £200 each really... We sell them for less becasue we support Atari like yourself, The development was a gift for PeST, but of course we had to have a lot of orders to make sure the project did not cost us in hardware...

Effile would only get produced again (by us) if a lot of people commited to orders, that means parting with thier cash in advance.. I used to ask for peoples word on orders for items, I have boxes full of stuff which people said they would buy, and I took thier word, so I brought items, and when it come to parting with thier cash they vanish. I think this is the problem, if someone made 50 units and produce cheaply, that someone would have a lot of stock to be stuck with for a long time... price goes up for units as nobody is going to produce them in bulk..

waffle over...

Chris

Why would you want to? Cubase is available for Windows already, so why not just get that? It would probably perform better than an Cubase ST under emulation.

The version is optimized for G4 and above. I have a dual-G4@1.25GHz.

One thing that you must do, so that it starts correctly, is to copy
the "Aranym_files" folder in the "Documents" folder from you user
account.

You can also try <http://ebmodel3.atari.org/Pack_3D/> that is more
elaborate, because it has pre-installed ATARI applications.

I hope it'll help.

> Emulators DO depends on software developed for original machines.. Its as
> simple as that...

When did he say that though? I mean in the past Francois has pissed me
off but this time I think he's only promoting a different possible path
for some people. And remember too, he doesn't speak for the Aranym
developers, he's responsible for the part of the MacOS port and even then,
he wants to keep that in the past and not allow it to run on intel macs
better (from my understanding). He's not one of "the" developers like
that did JIT or or natfeats or somesuch. All I think the point was was
that quake will run on aranym because the emulation is pretty good.

Thanks,
Mark

7871. Trouble builing in an aftreburner040

Newsgroup: comp.sys.atari.st

Source record: 7448

Hello my name is Will van Dongen, We are trying to build an afterburner040 and Nova graphic card into a Falcon. But we have troubles. The afterburner won't sync We have tried several clock patches but still the afterburner won 't sync. A friend who does actually the "building" is in search of Douglas Little. In the past Douglas build several afterburners into falcon's and had his shire of trouble.

But we can't find Douglas Little on the Net every link is dead. So we try it this way

Please Help some desperate people

And I want my Falcon back alive and kicking

Hello,

Are some of those items suitable for Falcons ?
Would you mind listing them, along with what you would expect selling
them for ?

Hi, all,

FWIW, The Berkely Microsystems BMS-100 is also detected by HDDriver (8.16). Not sure about earlier versions. It is detected as an Atari interface.

>charles.copp@sympatico.ca

Well,I am not ashamed to admit I do have copies of Cubase that are
'cracked' but I'l tell you why...

I bought my Pro24 and 1040Stf new in 1988 at a time when I was
involved with Peter Gabriel in promoting his Syco Systems company in
London. At the time he was the sole importer of the Fairlight CMI III
and I used to troll round all the top london recording studios pulling
together case studies to promote back to the international press/music
somebodies (the Fairlight cost in excess of ï¿½30,000 back then!).

At one studio - Trident in London - they were mixing down some Dire
Straits recent mixes and I asked what they made of the Fairlight's
Midi capability and they said, "Oh we aren't using that, we are using
the Atari over there..." and yes it was a Pro24/520st system!! So, I
had to have one too, but got a 1040stf instead. Bought it from Soho
Soundhouse (now Turnkey) in london and was so excited - a proper,
invaluable computer application long before the Mac and 'multimedia'
PC and even today, looks and works brilliantly. It was the better part
of a ï¿½1000 quid with the software and a MT32 module mind you...

Anyway, after a couple of years and hundreds of hours use, my dongle
started to wear as I had to constantly swap it out for other Steinberg
editors etc, and when I asked for a replacement as the system was
constantly hanging, they basically said, bugger off, we only support
our Cubase customers now...! I don't expect that type of customer
service, especially when I was partly responsible for their success!!!
Oh and yes, in those days, you used to have TO PAY to register your
software for further support updates etc... That was a further ï¿½25 (on
top of the ï¿½325 price tag) down the drain in this case!

But now I wish to access some of my old music again and I have the problem that Pro24 was pre GM Midi and allowed you to utilise sysex tone patch info by embedding a small .PAT pattern at the begriming of your song, so any specifically modified or created tone on your synths/modules could be instantly configured upon PLAY. This is what I want to attempt to translate over to a more modern system, now I finally have the time as I have given up the day job to piss about like this more!

I have dug out an old 'non dongled' copy of Cubase 24VST 3.7 for the PC (running either W95 or W98SE on an IBM Thinkpad) and yes, it hangs the system after about 35 mins - even if standing idle, but I may be able live with that in short term by using it only to tweak my creations and using the older ST apps for the basic compiling. In addition to Pro24, I have dongle-less ST Cubase vrs1 *which doesn't crash*, but the nicer vrs2.0 and 2.1 do and the last 16bit version - vrs3.0 - is a big disappointment as it hardly stays up at all and has that tempting Mixer Modules capability and that would have been great to explore...

So that is where I am. Sadly, things that don't work so well on the ST by todays standards make life hard - like low resolution clanky mouse, limited screen estate on the SM124 monitor and just a single 720 floppy... Also, I need to transport my Midi system and lugging that lot is not on. On the upside, I did invest in a 4Mb upgrade for the old ST about 10 years back and with a brilliant reset able RAM disk, I can work round crashes by frequent quick saves to it during sessions and recover something at least...

I hope I have answered all your questions? and not bored you all to sleep!!!

Cheers guys,

MG
UK

Hi

Yes I did load up Control acc and set the speed, - maybe not the 19200
though... Which f-key are you referring to on PC? I have been loading
Control Panel settings first, then Ghostlink on ST finally 'PC Slave'
at the c: prompt on PC and selected the slower speeds/com port nos
selection, but no 'f' key??

Thanks

I don't think people, these days, have a problem with prepaying. Rodolphe
seems
to have made it work with the CT60, and the guys doing the EtherNAT got 130
preorders
too. So, definately, ask for prepayment always with new developments for
Atari now, it's
the only way to fund things.

I got two Eiffels from Rory because no-one else was claiming to make them.
I'll
probably be looking for another soon (with LCD) to replace my QwertyX.

Alan.

>>

I don't think LLamatron will run on a TT or Falcon, never mind ARANYM....

>> Aranym is not the thing for you then. You should look around for a mac
>> ST emulator, like noSTalgia or hatari.

Isn't there a MAC version of LLamatron....

The question that is posed is quite special.

If I get the following Falcon30 Llamasoft game :

<http://www.llamasoft.co.uk/downloads/softography/falcon/llamazap-falcon.zip
>

That I unzip it in <http://eureka.atari.org/MacAranym.zip>, that I
boot with TOS4.04 rather than EmuTOS, and that I inactivate fVDI.

If I launch the game, there's no sound, and the game's intro
display correctly, but you can't play with it, and the game's
levels are not displayed correctly. This game is special, because
I think that it requires an analogical ATARI gamepad that I
don't have, though I own a basic Falcon30 hardware.

But in the same conditions, and performing the same precautions
with MacAranym, Quake will work fluently, with the game's sound,
and it can be played totally.

The explanation is that Quake is written for Falcon060, that is
a sort of customized hardware. I know that perfectly because my
devel machine is a Hades60 from Medusa, Switzerland. So that the

author from Quake's port had a very close care to build portable
binary code. Often, 060 code on 060 machines run the most portable
ATARI machines code. Mostly because it is clean, as would developers
say ... I develop programs on my Hades60 since June 1996 !

My answer would be that most of recent ATARI games will run on
adequate machines. But it is rather rare ... The good thing to
ask is not 'could I play that game that I beloved' ? But rather
'what are the good games' ? Not for interest for the game, but
rather for technical reasons ...

How far all these games are cleanly written ?

Quake is !!!! Would you like playing Quake ?

I hope it'll help.

Best regards,

Roger,
These are just double sided boards, so I will throw on the components and
test if it works. For a more complex job I would try and compartmentalize
the cicuit and test step by step...
Dave.

It was talked about a while ago, problem is people expect items to be "plug n play", a lot of people can't even solder, some think they can and will probably mess it up, maybe damage thier ST and PeST... Only takes 1 person to cause trouble so when me and Aly were talking about it we dedided not to bother doing it.... with the time involved in writing instructions, helping people with emails..... it just ends up costing us a lot of time to save someone else a few quid... IMHO it just aint worth it.... Its not just the raw cost of the parts and time for assembly either, a couple quid goes towards buying us a beer per lead for development also...

I have a pile of bits here, I thought about putting a box of bits on Ebay as haven't got any time to make them up anymore. Aly is still selling leads also, though I *think* she wants to clear out a lot of stuff also at the moment.. If someone wants to buy PCB's I have a few DIL types left, Aly has a few SMT based boards still which are slightly smaller....

Chris

Have you ever considered sending/selling only the PCB ? Or preprogrammed PICs
? The buyer then has to find the rest of parts locally and solder them on the
PCB. This would reduce costs dramatically and (perhaps) lead more people to
"make deals" with you. Of course, whether your time is worth all the hassle
of building the PCBs or not remains to be seen (and is your prerogative).

Oh no, Chris and his boxes and boxes he bought for other people. :-)))

Seriously though. Everyone loves the idea of talking about things, and then when it comes to handing the money over.. They do indeed vanish; waiting for payday, roof started leaking, car blew up. God, there's some pretty unlucky people out there.

It's the same right across the retro scene. Everyone wants stuff on the cheap. It doesn't work that way. The reason why microwave oven's at £30 a go is that they're mass produced in Asia, and the people making them are living in tin huts.

We don't live in tin huts over here. Well, we would be if we spent our entire time developing something that no-one wanted.

Onto this ACSI/IDE interface. If it was the 1980's RIGHT NOW, they would command about £200-£300, and with inflation, that's about £500+ in today's money. No one is going to pay that, except maybe Madonna or FatBoySlim with their ST's in the background in their studios.

Lately I've been moving away from the Atari scene and drifting over towards the music people. They love their STs with a passion, and know bugger all about how they work. We're talking about people who will happily go out and spend £300 on a gizmo just to make their Roland sound a bit fuller.

We're maybe getting into a bit of a rant here. But certainly, many people simply aren't prepared to pay. They want things, but don't want to pay for them. So unless they know how to do it themselves, then they have to decide whether they really want what they want, and if they don't, then they should stop going on about it.

I want a big pair of tits. Now this is probably the first you've heard about it. And this is the approach I use with my ST exploits and in finding a surgeon. I've got the money after saving up hard, and I'm under the knife in 2-weeks time.

If people want all of these ST mods and gizmos then I'll put the time and effort into building them. But just as I have to pay a surgeon to do what I want, you people out there have to pay me to do what you want. It's not arrogance, it's not petulence. It's the way of the world. I have to live. Chris has to live.

So at the end of that, we just gave in. I'm an adult model, and Chris goes to work everyday poking around people's televisions.

If anyone would like any pre-programmed 16f876's for their Eiffel's then no problem at all. I spent £200 on a professional chip programmer to develop PeST with, in that I have the kit and can do the job first time, while others fiddle about with resistors and bits of wire trying to build a programmer on the cheap.

The question is; How much is your time worth to you? And this is what it comes down to. People pay us to do things first time so that they don't have to do it and can get on with things.

You pay a plumber to do your plumbing. You pay an electrician to do your electrics. And you pay a builder to do your building. We're embedded development engineers and we do you embedded development.

Now to be fair, that's not a gambit you often see on a newsgroup :-)

Got the PeST, btw, Aly, and it works great :-) I figured it was a lot easier to just buy one from you (at a very reasonably price) than try to figure it out on my own. I *could*, (I've built all sorts of h/w gizmos) but it's not worth the cost in time when someone else has already done it and is selling it at a good price.

Good luck with the op :-)

Simon

I haven't been to a computer show since the Toronto Atari Federation last
held their expo. All of these vintage shows are never anywhere near my
home. Such a shame. :-(

In fact, I still hope to be able to build Eiffel myself but I'm sure others
would prefer the finished product. I have all the parts and need to find time
for the assembly (some kind soul has offered to program the PIC for me).

However, I'd love to have an IDE interface for the ST. With a Compact
flash/IDE adapter, this would be perfect for having some internal harddrive.
I had a look at Pera Putnik's schematics but it's not something I'm likely to
attempt (has anyone tried building the interface, besides Pera ?).

If I understood correctly what you're doing, you are copying the
above link in your WEB browser ... Right ? You should better click
on this hypertext link, then your WEB browser will open, and show
the contents of the Pack_3D site.

> Too bad its in the wrong language for me after teredesk started :|

In fact, translating the contents of the Pack_3D in the local
language, is part of the work that has been done for the package.

If you prefer another language, then just take the original one,
that is available everywhere on the WEB, or certainly better inside
the Pack_3D, usually in resources of programs (*.RSC files).

I think the amount of money people want to spend depends
highly on what has been spend on the original Atari
and how frequently the Atari is used.

If it is a second hand or a rescue from a dump, it wont
be very much.

I still use the original TT from 1991 which has cost me
6000 gulden (2700 EUROS in todays money).

I recently spent 140 EUR for a SCSI/IDE convertor
and a brand new laptop HD.

You need a switch that has both RJ45 and BNC connectors. I got such a
switch for 1 euro at Ebay and use it to connect my TT to my DSL router.
As far as software for the Riebel card is concerned I think there is a
solution for MiNT, but I am not sure. There is also a commercial
software package for TOS, which is called ANS (or something like that),
but it was not very stable and does not work with MagiC.
I only use the Riebel card when I am running Linux on my TT, and under
Linux it works fine.

Hi Pera!

Yes, you described (www) the USB-Floppy is not working with Fdrawcmd.

Other thing:
I met the problem not being able to make ST-disks at all, with Windows XP. Fdrawcmd too.

The DOS Proggies are working well. Also with big formatted Disks.

I haven't found an ATARI ST program, to copy ST/MSA files to floppy on the Internet!?
Have I missed something? :)

Look out for Magic Shadow Archiver or JayMSA. JayMSA is said to be buggy
though. For any real use, these tools need either a harddisc or at least
1MB of RAM and a RAMDISK.

cheers,
Matthias

Well, the problem is not really to get a 68882 emulation like your hades
or the CT60 TOS , but like the cf8klib with integers, rebuild the same
work for the fpu to get an FPU working like a 68060. Unimplemented
adressing modes is lot of work, the cf68klib takes 65KB of asm code just
for integers.

Regards,

Didier.

Yes indeed,

You need a hub with BNC and RJ45 connectors. But it is a whole thing to get a proper connection. You need at least two BNC-Y-plugs, one BNC cable and 2 BNC terminators.
(I'm still searching for the cable - I found connectors and terminators on ebay).

Sting 1.20 works fine with rieblcard. (I can ping to myself).
Don't use sting 1.26. It bombs me always away. You can test your card also with ANS (atari network services).

Mark.

The BNC cable is IMHO completely superfluous...

Thanks pretty much.

720KB DD Disks, driven by HD-drives are a kind of trouble to XP. Maybe a real 720 DD (Disk and/or Drive) would run flawlessly as a DD, under XP!?

Best Regards,

Daniel Mandic

P.S.: Teac-FD is my favourite.

I don't know about Llamatron specifically, but:

a) if you want a relatively inexpensive way to run many Atari TOS programs (in many cases far faster than an ST can), you want Aranym.

b) if you want your Mac to try to pretend it's an ST (speed, compatibility, etc.), you want STeem or Hatari.

c) if you want to be certain your Atari program will work, you want an Atari computer.

Put another way, Aranym will try to run TOS programs quickly while STeem will try to emulate the ST exactly. Neither works for every TOS program out there, but due to its nature, STeem is more likely to run an ST game. Since both applications are free, give them a try and tell us what you found!

Steem is on Mac now? I did a google but couldn't find anything
definate. I'm using Hatari on my G4, and it's OK but Steem on an intel
machine absolutely rocks.

Hm - readily assembled RG58 cable (50 ohms) with BNC connectors should be
available at most electronic shops (if in Germany: try Reichelt if your
local shop can't help). For a short distance (say 2-3m), RG59 (video, 75
ohm) or RG62 (Arcnet, 93 Ohm IIRC) cable should work, too. RG174 (thinner,
50 ohms) works fine for 10Base2 ethernet up to some 10m.

Source record: 7392

I picked up the following stuff recently, all with original diskette + manual. In the (IMO unlikely) event that anyone would like it for free (see fine print below), please respond via email in the next week or so:
Degas
Degas Elite
Diskscan / HDscan
Michtron Utilities Plus
Quick ST II / Quick ST 3

Fine print: You have to pay actual shipping + cost of padded envelope :-(. Let me know your mailing address when you respond & I'll give you an actual cost; it's likely to be in the range of $5-$7 Canadian except for Michtron (heavier manual). You can pay by PayPal or (at your risk) send me cash in the mail.

Roger Burrows

Find a web shop in the UK.
Google for addonics+adaec7726h
You also need a 50 to small 68 pin adapter.

> Ooooooooooh :-) Mmmmm. I could be running a CF card with that. And they
> take PayPal :-)
>

Should work.
Total costs are probably less then the cheapest new SCSI Hard Disc.
Which are heavy, noisy and convert electric current to heat.

Together with a regulated fan I now have a almost completely
silent TT.

Hubs with BNC may be a problem - my guess is that they are a rare item now if you are looking for a new one. However, used 10BaseT-hubs with one BNC port should be available for very low amounts - I have two that I saved from being scrapped.

If you are in Europe, you might look at the place that collects used electronics to be recycled according to WEEE. Ebay might be an option, too.

Hey,

Mine was shipped just a couple days ago. They're working but progress is quite slow because quite a few of the boards come back bad for them and they have to fix them. It sucks but have patience and it will come eventually like so many Atari projects. I plan to go nuts doing USB driver programming so cross your fingers and hope I know what I'm doing :-P

Thanks,
Mark

Any chance of of working with the existing USB programmer rather than
going off in your own direction? It's a hell of a lot of work and a
quite lot of it's already been done. You'll see what I mean when you
start reading the USB docs...

Coda.

Hi Henk!

Are you really sure this works? CF to IDE- on SCSI to 68pin and back to
50Pin, connected to the onboard SCSI of the mighty Atari TT. :)

Yes?

By the way, have you ever heard of SCSI-CF Adapter?

Best Regards,

Daniel Mandic

If the IDE-CF card exactly mimics a IDE hard disc, it should work.
Remember I talked about a IDE --> SCSI converter.
The converter has a 40 pin IDE on one side, a 68 pin SCSI
connector on the other side and tiny passively cooled magic
in between.

Its an amazing sequence of bits and pieces I have.

TT Mboard -->
50 pin SCSI -->
50 pin flat cable terminator -->
50 to 68 pin adapter -->
SCSI --> IDE converter -->
40 pin IDE -->
smaller 40 pin laptop IDE -->
laptop hard disc

Now, unless the old SCSI harddisc from within a cupboard has
suddenly become telepathic, I am actually reading and writing
perfectly to the laptop harddisc. :-)

>
> By the way, have you ever heard of SCSI-CF Adapter?
>
>

They have existed, but I couldnt find any real world example
today. (Well at least not in Amsterdam, some shopkeepers didnt
even start looking glazed, but none could deliver)

The IDE convertor suited me because I wanted to use
a laptop HD.

I understand. And with special power-cables on the 3.5"-2.5" IDE
Adapter...

> Now, unless the old SCSI harddisc from within a cupboard has

That's great. Ermm, small :)

> They have existed, but I couldnt find any real world example

A silent 2-8GB SCSI HD would fit me well. But as you said, today they
run with over 10.000RPM etc. (my goodness, 7200 is already to loud for
me. 5400 sounds more commode)

> The IDE convertor suited me because I wanted to use
> a laptop HD.

Would you say that a std. 3.5" IDE-HD could fit, together with a
SCSI-IDE Adapter, into TTs HD-hide?
Because I have some very silent IDE's around, with smaller capacities
about 1-8 gigs. The 245MB SCSI actually, makes me crazy :). It's louder
than all my other stuff... also my other older SCSI drives, about

540-4300MB, are too loud or with unwanted vibrations. e.g. My whole Desk hummed when I drove a SGI Quantum XP 2.1GB with AHDI.

I assume HDDriver is a must to get adapted IDE run on Atari-SCSI!? How about the speed with your Notebook HD? Can it go over 2MB/sec?

Best Regards,

Daniel Mandic

Yes, room enough. Put the HD as close to the front as possible.

> I assume HDDriver is a must to get adapted IDE run on Atari-SCSI!?

The combo !IS! a SCSI HD, so any SCSI driver will work.

> How about the speed with your Notebook HD? Can it go over 2MB/sec?
>

I havnt measured. I didnt notice much difference in speed, so
I think it runs at maximum available.
The speed will always depend on the capacity of the TT's SCSI
controller chip. IIRW this is 5Mb/sec

Important!!!
The converter doesnt terminate. If used alone internally you
must terminate with a external terminator.

I assume the current programmer is making a framework. That means that
drivers will still need done.

i.e. they're doing the OHCI bus interface and a driver will need done for
zonet bluetooth chipsets, etc. Of course I'd reuse whatever is out there.
I'm not crazy :-P

Thanks,
Mark

yes i am not bored to say the least , you took ,sustained and carried
through , lots of musical ambition...i am glad to have took time to
reply to posts.....i like hearing what you had to say.........i have
been making midi music for myself with atari for approx 5 to 6 years
and still to this day can not find a "co-partener" or computer
buddy...i assume the good old days of merging and "jamming" are over
and over run by the bedroom flunkies how make music on the pc's ..i
have a great none crash cubase3 and audio falcon ...plus the real
dongled versions...what is your version one like?
well thanks for your time and i do have manual too if need
update/reference????

sounds like we need to "coach the big man back to the ring" and maybe
do some trading , but as for the pc versions , i am unaware as to what
we should expect.
i have tryed to print from within steem to file and to printer port
unfortunatlly computer not configured and unsuccesfull.

thanks buddy
charles
i am also going strong with gfa midi programming ,spend lot time
developing midi ideals ...music /work/etc

Ah, that sounds good!

Would you tell me please, what kind of Adapter the 'PCMCIA to CF' is?
Costs?

Performance? MB/sec?

Although, the durability of a CF Card is limited. Limited R/W
accesses...
Maybe a HD is more overseeable for oncoming errors!? :-|

Looks Nice!

With the obvious SCSI copper stripe :) (had only SCSI from the beginning, AMIGA with all avail. CPU's ;) and now the TT. I will have to check my old IBM0662S2 for vibrations... I remember it being fast, about 4.5MB/s synchron)

I have here lying around, a IDE2.5 to 3.5 Adapter..... Well, it's interesting. If anything works well in the TT, I might buy one of the silent Notebook drives, but they park all the time :-(. I remember startup-sequence entries which disabled that behaviour with a IDE-command, but can they be translated via a SCSI Interface!?

By the way,
how much capacity (unformatted) is on your 2.5" and which driver do you use?

Kind Regards,

Daniel Mandic

Hi Daniel!

DM>By the way, have you ever heard of SCSI-CF Adapter?

Heard of: Just rumours, presumably here in the newsgroup. Seen: no.

But I've got a solution similar to Henks:
ACARD AEC-7720U SCSI to IDE adaptor, connected to a generic ATAPI
card reader device for MS, SD, SM and CF cards. On the Falcon, it's
even bootable :-)

Petr may have seen it when we met at OFAM last week :-)

With best regards
Ekkehard

Thanks to your informative replies, and to other user.

Now my sight is opened for the way I will go. Most obviously something silent.

Best luck with your TT. My TT has overrun the AMIGA now. I mean, for my kind of work, a ST is 'The Solution'.
Its "being-behind" MIDI-playback is unique!

The IBM-PC marches too forward... (Cubase, for comparison). DOS might be the better way. :-|.
:) ... who cares. TOS is the Windows DOS :-) (straight, and powerful for that times. drag drop move etc...)

Hello,

Only one bugfix in the games per se:
- Correctly convert audio when 16 bits stereo device not available.

The rest of the bugfixes have been done inside the SDL library, and will
be available with the next stable release (1.2.12 I think):
- Fixed keyboard mapping and management.
- Fixed mouse management, allow mouse grabbing.
It means you can use mouse to play a game, even in a GEM window.
- Fixed audio interrupt, where FPU registers where not saved/restored.
Well, any SDL application that use the FPU could crash/bug if audio was
enabled.

In Doom,Heretic,Hexen, grabbing/ungrabbing mouse is done by pressing
Alt+G, as stated in README file.

At the moment, I have TOS 2.06 on 2 Chips that are on a TOS 2.06
switchable upgrade board. It has its own 68000 chip.
I think its a Wizztronics upgrade.

Anyway, I'd like to get TOS 2.06 working in the STacy that I have
opened up at the moment. It's possible to piggyback the whole
upgrade over the stock 68000 but its going to be a tight fit with the
board that connects over the STacys 68000.

Wouldn't this upgrade work in the STacy if I can get it in there?

The docs do mention piggybacking the 68000 over the stock
68000 in the Atari that you use it in if the stock 68000 isn't
socketed.

If I could use just 2 TOS 2.06 chips, then that would be great.

I do have a EPROM Burner. But would need to get the some
blank chips to burn/program.

From what I understand, although CF chips themselves are limited-write,
the cards have built-in wear-limiting software, so continual writes of
(for example) a directory sector are spread around the actual RAM
chips, thus prolonging life.

7948. STacy Hard Drive

Newsgroup: comp.sys.atari.st
Date: 2006-09-18 13:25:44 UTC
From: phantomm <phantomm@bellsouth.net>
Message-ID: <k7xPg.10582$GY5.5412@bignews6.bellsouth.net>
Source record: 7325

Greetings,

I have a STacy with a 20meg Conner Hard Drive which is the stock
drive AFAIK. For some reason the drive isn't working.

The STacy works fine without the hard drive.

None of the Hard Drive software that I have tried such as,
HD Driver, ICD, Atari, etc finds the hard drive!
All say something like no drive/device found or similar.

Is there any software related problem such as deleting
the Hard Drive Driver file that would cause this?

If so what would be the fix?

I have the STacy apart in case I need to replace the Hard Drive.

(BTW I don't have any STacy system disks or a manual)
I do have another STacy here with hard drive that does work,
and would like to get the other hard drive fixed or replaced.

Does anyone know what type of Hard Drives will work as a replacement?

Or are these one of a kind drives and I need to get a replacement from
another STacy or a Dealer like BEST/B&C?

Any info is appreciated.

phantomm@bellsouth.net

If none of the drivers finds the drive there is most likely something
wrong with the drive or the cables. If possible try if the drive works
on another machine, in order to find out whether it's the drive that
causes problems or something else.

> Does anyone know what type of Hard Drives will work as a replacement?

I would expect any other drive of the same format to work.

I have never heard of such an adaptor, but if something like that exists
google should know about it.

The hard drive is SCSI. Any 50pin 3.5" SCSI II hard disk <=1GB should
work. Bigger drives should also work, but the host adapter won't let
you see more than the first 1GB.

Coda.

7953. Voltage measuring with computer?

Newsgroup: comp.sys.atari.st
Date: 2006-09-18 20:32:48 UTC
From: Something <*****@*****.***>
Message-ID: <*****-5A5239.16324818092006@news.isp.giganews.com>
Source record: 7331

Hi

I used to program my STs in assembly and when I switched to Mac never really got into programming on that.

Still have a few STs and would like to set up a little thing where I can hook up a few solar panels to a voltage meter which can send the data to the computer so I can keep track of power output over a longer time period.

The hardware exists for newer computers in the form of USB loggers but it would probably be easier for me to whip up the software on my ST - plus it hasn't done anything useful in many years.

Any thoughts?

Peter

You could easily do it with an 8-bit A/D chip and the parallel port.

Good idea to be honest. But.. Let's look at the two standards; SCSI =
Reliable, robust, proven standard. USB = Overdriven fast serial standard,
buggy, cheap solution to provide cheap quickly produced gimmicks to the
greedy boss eyed general public.

In some ways, what everyone is going through at the moment in terms of IT,
we ALL here saw before in the 1980's when there was much more reliability
and personal innovation. I think we all learnt our lesson back then, hence
aren't spending ?400 today on a graphics card every 6-months to run Doom
reincarnation version 1299.

ALOT of the stuff today simply doesn't work properly.

7957. Vision & AHCC alpha testing

Newsgroup: comp.sys.atari.st

Source record: 7335

LS

I am looking for people who are or have been using the program
Vision of Jean Lusetti.

I have downloaded the sources from TOPP and compiled with Pure C.
(Had to solve a few issues :-)

My intention is to recompile with AHCC and compare the behaviour
of the 2 binaries.

Because I am very unfamilier with Vision, I never used it and
I nave nothing to load into it, I am looking for a experienced
Vision user who could try things out much easier than me.

I chose Vision because it is a really large program and
I already have succesfully compiled my own programs.

Hi Peter!

X>What about a SCSI-USB adaptor for memory sticks. Is such a thing even
X>possible?

Possible? Sure. You'd need a (rather large) micro controller that
implements both SCSI and USB. It would have to present itself as
SCSI mass storage device and do all necessary format and protocol
conversions transparently, just like the SCSI-IDE-Adaptors do. But I
doubt such devices are readily available, as nowadays it's much
easier to just insert an existing and cheap USB card into your
computer's PCI slot.

Hopefully, some day we will see also drivers for those cards on the
Atari (Hades and Milan)...

With best regards

Ekkehard

Hi Charlie,

Just looking for an executable. Found a book earlier with lots of Logo examples in it and it brought back memories.

Logo is a mathematical programming language which was developed for children in the 1970's.

I think there was actually an Atari version of Logo, much along the lines of ST BASIC. ST LOGO?

Aly

7964. ethernet for STE?

There are a couple.

Lantronix UDS10 - serial port to LAN converter. Limited to telnet and
serial port speeds of the ST, up to 115k. (looks like they've replaced it
with a new model, the 1100). I use one of these to run my BBS (see sig).

http://www.lantronix.com/device-networking/external-device-servers/uds-10.html

EtherNEC - basically a standard PC ISA network interface card that plugs
into your STs cartridge port. It uses the STing software stack. Once
setup, you'll be able to surf the web, do e-mail, etc,..using standard
applications like CAB/Highwire, MyMail, etc,...Rory sells them, check here:

http://fujiman.no-ip.com/

There are a few other solutions being worked on, for example, the
NETUS-Bee, follow the message thread here:

http://www.atari-forum.com/viewtopic.php?t=8407&highlight=

Homepage here:

http://hardware.atari.org/netusbee/netus.htm

ISTM that the Atari ST LOGO was called DR LOGO. The DR was for
Digital Research, the folks who developed GEM. I believe that
Gary Killdahl himself wrote this for his kids to use back when.

Hi Ekkehard!

Unfortunately my Falcon doesn't have a PCI slot :-(

I do have a USB-SCSI adaptor for my son's PC so I can use an
EZ-135 on it to transfer downloaded files to my Falcon's EZ-135,
but using a memory stick or key for this would be much easier!

Regards, /Peter/

Hello Patrice,

I have to say the stability increased a LOT with audio on! All games
are now fully enjoyable! Just a little bugreport: in Hexen there's
corrupted pallette when you fight. It can be reproduced when you choose
Fighter and try to punch someone or just press space when you're near
the wall -- the dust sprite has bad palette.

7971. FidoNet...

Any old Atari sysops out there (or anyone else for that matter) who had FidoNet experience back in the day?

I contacted the FidoNet site, and they said they would love to have Atari BBSs back with FidoNet...

FidoNet was something I never tried back when I had my BBS in the 90's so I've got no first-hand experience at all.

Any comments, suggestions, etc, welcome.

Thanks.

7975. Mounting a Windows share on MiNT (need help)

Newsgroup: comp.sys.atari.st
Date: 2006-09-20 20:07:25 UTC
From: Paolo <paolo@null.nul>
Message-ID: <1chQg.116704$zy5.1700819@twister1.libero.it>
Source record: 7252

Hi everybody!
I finally managed to setup my brand new Ethernat on MiNTnet. It works like a charm, but remember to put the LAN plug first ;-) (I lost half an hour trying to figure out what wasn't working...).

Now that I have network connectivity (pinging, browsing and all) I'd like to mount a share available on my NT server instead of FTPing it. I read a lot of docs while setting up MiNTnet, and now I forgot where I searched in the first place.

So:
Can you please tell me what is the procedure to mount (let's say as drive M:) a windows shared disk in my CT60+EtherNat+MiNT.

I remember that Samba is involved, but I can't remember the whole lot.

Thanks

Hmmm, there is a nice and simple, but expensive solution: if, by chance you have one of those Hewlett-Packard voltmeters with IEE488 interface (also known as HP-IB or GP-IB interface), you can use a pocket-sized IEE488 to RS232 convertor produced by IOtech (a company which has sort of specialized in IEE488 equipment). Communication with a voltmeter, or anything else that is hooked to the IEE488 side of the converter (up to 7 devices) is easily estableshed by sending and receiving ASCII strings through the RS-232 side, and so it is very easy to code a controlling application.

I already read it, but it doesn't mention a sort of "mounting" the
device in order to be "seen" as a normal disk (and, no, Bnet didn't work
for me :-( )

7980. Eureka RTC

Newsgroup: comp.sys.atari.st
Date: 2006-09-21 00:01:29 UTC
From: Roger Burrows <sergeantvimes@yahoo.ca>
Message-ID: <v7l3h29tt5d2inlcu6u1ckole5it5o1gmq@4ax.com>
Source record: 7257

I acquired one of these recently and after replacing the battery, it works just fine except that the supplied clock-setting software doesn't support dates after 1999. I found a workaround on the net, but it's a bit ugly so I decided to write my own. It seems to work fine, but I'd appreciate a little extra testing before I release the code as freeware (source too).

If you're using a Eureka RTC & would like to help, please email me.

Thanks,
Roger Burrows

Hi Roger,

Excellent! I've often wondered why the ST programmers don't do these kind
of useful projects.

I have a Forget Me Clock II??

Aly

The advanced joystick port IS an ADC. The problem is that the range of these ports is 0-5v and the OP will probably want something that will safely measure upto about 20v. He could use a device to scale the voltage down if he doesn't mind losing resolution and maybe some accuracy.

It's not really the information that you want. The Sparemint Samba
client is here:
http://sparemint.atariforge.net/sparemint/html/packages/samba-client.html

Install it and read the docs. You should remember that this is a unix
port of samba, so you shouldn't have any problem finding information on
the web.

If fact I'm going to install the client on my freemint system now....
I'll keep you posted.

Ok. This is the procedure.

You need to get the samba-common package from here (as well as the
previously mentioned samba-client package):

http://sparemint.atariforge.net/sparemint/html/packages/samba-common.html

Install this one first with 'rpm -iv samba-common-3.0.1-1.m68kmint.rpm'
next install the client: 'rpm -iv samba-client-3.0.1-1.m68kmint.rpm'

You need to edit a couple of files. Look in /etc/samba for lmhosts and
smb.conf

In smb.conf you need to change the workgroup name (default is
'MYGROUP') to whatever your windows box is set to (default is usually
'WORKGROUP'). Next look for the interfaces line. Take out the preceding
';' and change one of the IP address to your atari's IP, like this
'192.168.0.5/24'. The /24 is the way it specifies the mask. This is
equivalent to 255.255.255.0, so leave it as it is.

In the lmhosts file you can put the name of your windows box, and its
IP address. This can make it easier to use it later.

Once you have done this you can test it with:

'smbclient -L <name of windows server> -U <name of share owner>'

I.e 'smbclient -L windozebox -U fred'

It will ask for 'freds' password, type it in and it will give you a
list of all shares that are available. Then you can do a 'smbclient

//windozebox/<share> -U fred' which will give you a prompt 'smb: \>' which is an FTP type interface. You can use this as you would an FTP client. See http://us5.samba.org/samba/docs/using_samba/ch05.html for more information.

Once this is all working fine, you can mount the windows share as a directory. The only thing is, I'm not sure how to do that, as I can't find an smbmount program anywhere... and I have run out of time today.

Don't I wish. The clock works fine past 2000. When I first dug it out
after ten years it read 2005 odd.

It's only the software which stops it from being set to 2006. Mmmmmm. Hex
editor. Ho hum. Like I'm going through changing every '99.

Source record: 7264

Hello,

The problem with th FMCII software is that it won't go past the year 1999.
The hardware RTC is fine, just that the software can't set it.

SOLUTION.

Edit the file FMCII.PRG with a hex editor. Find the first two occurences of
63h Change these to 6Eh. And save.

Your FMCII.PRG program can now set dates upto 2010. :-))) 2006 is 106 in
the FMC software.

Yayyyyyyyyy!!

Aly xx

ps. when 2010 comes about, just change the new 6Eh to whatever. Changing it
to 7Fh makes it good upto the year 2027.

Newbie question: I read "Available as an internal or external device and
for the following computers: Any Atari that can run MiNT or MagiC".
So, I assume it can't be used under TOS + Sting ?

Thanks !
Simon

Nope, that's not right. It works fine under STing. You have to copy some drivers into the STing folder, config a few screens, reboot, and thats about it. I know I don't remember anything too hard about it. Oh, the IP adddress, I had to ask (I believe it was here, in this super helpful group) about the format for it, but other than that... I had it setup and working on a Mega ST4.

HTHs. :)

Thank you all!
Samba is working like a charm! (no device mount, though!)
unfortunately, for the desktop kind of work, it is not suitable: aFTP is
extremely better integrated. I know, Samba is modern, powerful, and
doesn't need an ftp server working on the other side. however, aFTP is
more user-friendly.

Now let's talk about Sharity-light (jan, this could interest you as well).
Maybe I just don't get it, but it stays forever 'waiting' and then ends
up with an 'unknown host' message.

is it possible that it doesn't need a config file? or maybe it should
point to smb config file? I am puzzled and stuck about this.

Hi,

Lots going in East Anglia, UK. Don't buy off of eBay and get unknowns!

Fully specced kit. 4MBytes fully refurbished, useful software, boot discs, manuals, with PeSTs. TOS 2.06 chips. Floppy drives. Happy Discovery cartridge. ST1224 mono monitors, Phillips Color monitor, NED Multisync 3D (with high/med/low switch box), Eizo Multisync (ditto).

Two fully boxed and complete Discovery packages. 4MB STFMs absolute grey and spotless (still with plastic over badge).

I just want it all gone. And an immaculate original Mega STE 4MB with 42Mb hard drive and 1Gb drive. One STFM with a MSTE keyboard and switchable 4MB/1MB.

LOADS of books. Loads of ST Format magazines. Loads of software. Some software totally mint and complete; eg. Starglider 2 wrapped condition, Carrier Command wrapped condition. Magnetic scrolls complete.

Lots of rares. I just don't have the heart to take it all to the dump.

And a Commodore Amiga A500. 1st buyer of anything up above gets it (and it's software, PSU, modulator, mouse).

I really do not want to look at this stuff any more.

No fast pitch sales!

I'll keep two STs back, but the amount of kit I'm hoarding is a bit OTT.
I'm just getting fed up with it. Trying to do new projects is difficult.
Everyone has a better idea of doing something amounting to a few sentences.

Aly x :-)

I had this problem. The answer was to put the hostname and ipaddress
that has the share in the /etc/hosts file, and use the hostname instead
of an ipaddress: shlight //hostname/share/ /mnt -U <username>

BUT even wth this, Sharity doesnt work on my system, complains about
mount request to kernel failed, and nfs mount /h/mnt Function not
implemented.

I don't know specifically for the Atari platform, but SMB is slower for
transfers compared with FTP (about 2x as much on my system)

I DID IT!

And it works!!!
Just put nfs.xfs in your mint dir and be sure to mount to
/nfs/whateveryoulike

I even managed to set this up into my init procedure.

The only thing is: drop windows. It doesn't work there (as usual, BTW)
since it would need a proper NFS daemon. I keep getting wrong answers
after login/password ending with a no-go.

Again thanks everybody.

So, now, let's go to the next question :-)

How do I print to a network printer (a la CUPS in Linux)?

lp works only under Sting
Samba, well, I couldn't use it for printing even in linux (and I used
CUPS since then)
and
I want a mount!!! So I can print to U:/printer from my applications

Who is picking this new challenge? ;-)

Hi,

I've a MegaST with his interface working quit well. If you want to use
only TOS then it is a very good choice. If you want other OSse or for
example ATSpeed, then the interface is not compatible.

Yes, I only want to use the TOS. However there's no email to get in touch and
like I said all is in polish (including instructions). How did you order ?

I expect the interface to be quite slow though (i'd say 100 Kb/s max for an
ST) but well enough for the system. Is this what you get, "Joe Iron" ?

I changed it to 9F in the end which is 2059. That's highest the RTC seems
to go. 2060 produces a failure. It's on Atari-forum at the moment;

You can find his e-mail address at: http://www.paskud.pl/. Click on
"e-mail do mnie". Simply write him a letter in English. Though his
english is not too good, I could finally bought my interface ;).
Concerning speed: I didn't do deep testing, but the speed is more than
acceptable. (if you don't forget, that you use an ST ;))

Thanks for the info Guys,

I've a few SCSI drives around a Gig or so that should
work then.

I believe the original drive blew a seal or something.
I found sometype of grease along the back seal of
the hard drive and on one side of the ribbon cable.

few years too late for that one im affraid! Atari machines were a bit of a
pig for getting parts and servicing, was nice to see the 68000 CPU in a lot
of the stuff though :)

Thanks, every compliment helps :-) BTW, I did get one response - from
Claude (who works with me on the CD writing stuff). So now it's
thoroughly tested ;-), I was wondering where to post it: to the Belgian
ftp server? Suggestions/recommendations welcomed.

Roger

8043. FreeMiNT/XaAES on the ST

Newsgroup: comp.sys.atari.st
Date: 2006-09-27 12:06:38 UTC
From: GokMasE <gokmase@gmail.com>
Message-ID: <1159358798.445624.205900@m7g2000cwm.googlegroups.com>
Source record: 7220

Hiya,

As many of you certainly are aware of, FreeMiNT/XaAES have not been
running on 68000 machines since XaAES was turned into a kernel module.
Reason for this was mainly the lack of test equipment, a problem that
has been cured since.

Todays very early pre-alpha binary of FreeMiNT/XaAES consist of 3
subdirectories, and if copied onto the root dir of your boot disk it
should enable you to boot right into XaAES with Teradesk launched as
desktop. Also note that the sysdir is 1-17-cur for this particular
version of FreeMiNT.

In order to use this version of FreeMiNT/XaAES you should have at least
4Mb of RAM. If you have an Atari with 020 or better CPU you are adviced
to use the latest alpha release instead of this 000-specific build.

Grab the binaries here: http://xaaes.atariforge.net/

Regards,

/Joakim

Great News!!

I've checked and it doesn't startup from harddisk:

pid 0 (MINT): parse_cnf: can't open u:/a/mint/1-17-cur/mint.cnf
No init program specified to be started.

Starting up `u:/a/mint/1-17-cur/sh'...
error -34.
System Halted.

Best regards
Cyprian

This sounds strange. What hardware are you running on?
And how much RAM is installed?

It is clear that the problem is due to MiNT looking for the config file
in
the wrong directory, just unclear to me why it does that.

I don't know if it is a problem or not, but I prevously tried to run
MiNT with Steem (the emulator) and it behaved the same.

I tested with Steem here too and can verify that it results in exactly
the problem that was reported earlier in this thread. However, it
works a treat on my MegaST4.

Hello,

Would anyone know of a source of 40 way edge connectors as seen in the image below?;

http://www.logicsays.com/pub/edge40.jpg

I've checked the various sites; RS, Farnell, Rapid, Maplin etc. RS do them for £30 per unit. Maplin do 62 way (2x31) units for about £1.50.

I'm looking ideally for right angle PCB mount connectors.

With thanks,

Alison

someone is there since in the last few months they changed their keyword
you have to type in to post.

Alot of these Atari sites suffer from this; lots of dead links and mails
bounce.

Check the US houses like Mouser. $5-$10 each in small quantities.

http://www.mouser.com/search/Refine.aspx?Ne=1447464+254016&Ntt=*card***edge***connector***40p*&Msb=0&Mkw=card+edge+connector+40p&N=1323038+0

Also check Jameco as they tend to be cheaper for stuff like that.

Thanks,
Mark

It's evl, DHS, Anders Erikkson (sp?). He's always around, get on irc and
go to an IRCnet server and go to #atariscne. You'll find him. He tends
to be around at off hours for where he lives (daytime hours for me).

Thanks,
Mark

Hi Mark,

Thanks for the reply. The trouble with the US suppliers is that by the time they've added carriage it's just not worth doing. I was quoted $75 to ship something weighing 50grams a few months back which wasn't up for discussion, so I don't buy from abroad unless they charge what it actually costs.

Just checking this company for delivery to the UK..

Minimum Order: 1000. So that's that out.

Thanks :-)

Aly

8055. Who is interested in XaAES for the ST?

Hi all,

We would like to know what kind of interest there is in keeping
FreeMiNT/XaAES compatible with Atari computers that lack the PMMU.

There are some big changes coming, and Ozk needs to know if there is
enough interest to justify the work needed to maintain compatibility
with setups that lack the PMMU. So how many many Atari ST/e/fm users
are still interested in running XaAES?

Feel free to discuss this matter here, but to report your interest you
should post a comment here too:

Hiya Steve!! :-)

Thanks for the links, I'll check those out over the next few days. Sorry I hadn't replied earlier, I was checking the overall cross posted thread.

These are the standard connectors for the Atari ST cartridge ports. I'm just toying with the idea of having a fresh batch of cartridge PCBs made up so those nice Atarian people can start blowing EPROMs again. :-)

Very, very few ppl use edge connectors any more (especially in the UK). That's your fundamental problem here.

Why do you need one ?

Graham

I have a passing interest but last time I checked only 500KB or 1MB is
free when done booting XaAES. The 2.5MB left after MagiC isn't really all
that usable so I'm going to have to say no. Leave the 68000 machines to
MagiC.

Thanks,
Mark

Hi,

> We would like to know what kind of interest there is in keeping
> FreeMiNT/XaAES compatible with Atari computers that lack the PMMU.

I am so crazy and try nearly everthing on an old ST without PMMU. From this point i would like the ability to run XaAES on such machines.

But at the other side there is to less RAM available if i boot with MiNT, NVDI and XaAES to work seriously with this machine. Only with a emualtor which gives me mor than 4 MB ST RAM it was usefull. A reasonable decision was to leave such machins behind and look anly at Ataris with more RAM which mostly have PMMUs (like TT, Falcon).

Best Regards
Michael

Ah, now first mistake is assuming that I *need* one.

It's all of those Atari users that actually need them, and if they're
willing to part with their cash then I'll get 50 or so bare cartridges made
up so they can burn EPROMs full of hacking applications and make alsorts of
obscure dongles.

Thanks to Aly, Mark and George. Anders emailed me a day or so ago to
say that he's very busy, and only changes URL redirections when there
are a few to do.

As a corollary to the subject matter, please all note my separate
message concerning DDP and CCC direct URLs.

Message-ID: <2006093020424825484-derryck@cixcoukinvalid>
Source record: 7152

If your bookmarks for the above directly reference
http://www.cix.co.uk/~derryck with either home, ccc or ddp pages please
note that I have MOVED to another ISP, so these links WILL NO LONGER
WORK.

For an indeterminate time until Pipex get around to actually removing
the pages on CiX, there will be a redirection URL to the URLs that I've
been mentioning in my sigs, viz:

http://ccc.atari.org (Cheshunt Computer Club) and
http://ddp.atari.org (DDP Translations)

You will be able to access other pages via links from either of these two URLs.

My email address stays the same.

Webmasters please take note!!

I'm a member of the Nixie (tubes) mailing list on Yahoo, and an
American member of it included an order for some stuff from Digi-Key
for me - it helped us both, as his order was going to be below their
minimum, and mine, as I'd have had to cough up a ridiculous amount.

Worth thinking about if you're in this situation again. I'm sure
someone here would help you out.

Hi,

You may be interested by the following uptodate version of ARAnyM.
Very latest devels have been taken into account.

- The Pack_3D at http://ebmodel3.atari.org/Pack_3D/ that works on
3 OS/platforms including Windows, Linux and MacOSX.

It includes ARAnyM 0.9.4beta and

EmuTOS dated from 2006/05/22
FreeMiNT+XaAES from 2006/09/23
TERADESK 3.84
EB MODEL3 3.62a version (only available in this pack)
EB_DUMP 0.9.7
EUREKA 2.12 beta from 2006/09/09 (only available in this pack)
QED 5.0.5
POV 3.1g
ZVIEW beta 7
ZTASK 1.0
MESA_GL 0.93 version (derived from Mesa3D 2.6)
CAB 1.5
HIGHWIRE 0.3.0
HYP_VIEW 0.35.2e version
PAULANG 0.2b

ready to start with. Quake 1.01 works great with it ! Really.
You may have a look, for Quake, at http://www.dhs.nu/

- The minimum pack at http://eureka.atari.org/MacAranym.zip that
is built for MacOSX.

Enjoy :)

I bought 2 Beetle mice a number of years ago and put them in storage. However, both seem to have developed the same problem during storage, I have left-right movement of the pointer but only upward movement in the vertical axis. My Wizzard mouse works fine so it is not the port. The Beetle mice behave the same way whether it is my TT or my 1040ST. The internal wheels turn. Seeing how difficult it is to get Atari mice any suggestion on a possible fix would be appreciated. Both mice worked when purchased, I checked, so something happened during storage.

Thanks

Alyre

Hello Tom Tom!

> Do you know by chance if the format of the drive is the same as the
> regular ST or if it is the same as the TT/Falcon?

The "format" of the ST-Book-Drive is a 2,5"-drive as used in
notebooks/laptops.

> Since the drive is IDE, can any drive be used in it or does it require
> certain models?

If I remember corectly these machines had problems with drives bigger
1GB capacity, so if you find somewhere a 500MB-drive it should be
possible to install.

> What means will the drive need to be formatted and with what software is
> recommended?

Is there a "format-software" (AHDI sp?) in ST-Books permanent RAM-Drive
(I don't remember...)
Otherwise the best chance is to take a FALCON (only other Atari-machine
with a 2,5"-drive"), put the "new" ST-Book-drive in it, format with the
software from the "language-disk" or third-party-software as "HDDriver",
and put this drive then in the ST-Book.
Voil&#65533; - Should work...

Best Regards, Werner

To add on to what was mentioned about the ADC input...

All Atari computers have a simple analog to digital converter with the potentiometer inputs on the joystick port. Using this and a simple voltage divider (two resistors connected in series to the voltage source). Make one resistor (the first resistor in the series) a potentiometer (variable resistor) of about 50k ohms. The second resistor a 10k ohm. Adjust the variable resistor to either 30k or 40k ohm resistance. When set to 30k ohms this would scale the voltage down to 1/4 of it's value. At 40k ohms the voltage would be scaled down 1/5 of it's value. Tap across the 10k ohm resistor to get your scaled down voltage. Connect the node with the asterisk to the pot input on the joystick port and connect the ground pin on the joystick port to the other end of the 10k. You can then adjust the pot to scale the voltage. You will need to be careful that you don't dip below 30k ohms so you don't exceed the 5 volt input limit.

```
50k 10k
voltage source -----/\/\/\/\----*-----/\/\/\/\-------gnd
Center tap---> ^------|
```

You could make this even safer by adding a 30k ohm resistor in front of the pot and lowering the pot value to like a 25k ohm. This way should the pot be turned down to where it's at zero ohms (or close to it), the voltage across the 10k shouldn't get to much over 5 volts. Keep in mind this is all based on nominal values. Actual real-world resistances will vary.

Once you have this hardware setup going then you can experiment with reading the pot input to the joystick port and map out what input voltage values relate to the decimal readings you get from reading that port. You can do this in basic.

And like what was said before you will lose resolution into the value of the voltage by doing this scaling down with the voltage divider and connection to the pot input on the joystick port. You will only be able to read the voltage in discrete steps.

If your goal is to just get an idea of the voltage without too much accuracy then this voltage divider method should work well. But if you need accuracy then you will need to find some sort of digital multimeter (DMM) that has the ability to report a voltage readings over some sort of interface like RS232. But then you will need to write some sort of utility to convert this RS232 information in whatever form is being reported in (e.g., text, encoded binary, etc).

Another alternative would be to use a PIC microcontroller that has an ADC (analog to digital converter) built-in and interface it thru the joystick

port and provide this information. But this will require some sort of application or code on the ST to monitor the joystick report and collect the data. You may need to use a specialized ADC chip to do the voltage conversion depending on the level of accuracy you need. Most microcontrollers that have a ADC built-in would probably be better than the pot input to the computer. But if you need high accuracy you will need to use a more specialized part.

There are many ways you can accomplish this, just depends on how much you want to invest and what your level of accuarcy requirements are that determines what your solution options would be.

Good luck with your project. Let us know what you were able to come up with to do the job.

General problems with IDE drives bigger than 1 GB are unlikely because
there is no IDE-specific limit at this size. Provided the ST-Book has a
standard IDE interface, which I think it has, there are no limits that
do not also apply for other Atari machines.

My vote shouldn't count much, but I'm interested. I have an STe and a Mega ST that i'd like to try with FreeMINT/XaAES. I don't even know how to start. (I've only run TOS and OS/9 on them, and not recently.)

How much work is involved? Does the constraint impair support for newer machines?

Hello Derryck,

sorry for that delay, I got a phonecall today (from the USA!) about
this usenet thread. As I don't have any usenet program setup, I'll try
to use my google account to reply, I hope it works.

Yes I'm a bit swamped with stuff to do, and it never seems to end. A
good thing with that - I seldom get bored but bad thing is that
sometimes people will wait for too long for a reply. Somehow my other
site, http://dhs.nu/ (nice, now I managed to make a plug of that too)
feels like my precious pet and get more attention than the other one. I
should probably prioritize different.

On the positive side, Atari.Org have it's best uptime ever. For the
last three years, we've had nearly no hickup. An afternoon here and
there due to upgrades and powercuts, but nothing dramatic. Hopefully it
will continue with similar stability in the future.

8094. SLM605 drivers and printing weirdness

Newsgroup: comp.sys.atari.st
Date: 2006-10-02 04:10:53 UTC
From: Rory.A.McMahon@gmail.com
Message-ID: <1159762253.685445.151010@i42g2000cwa.googlegroups.com>
Source record: 7171

Hi all,

Got a tough one....

Does anyone have the latest Atari drivers for the SLM605? Cant find the disk(s) here at home or online...

I have v1.2 driver for the 804, which works somewhat. Printing problems have arisen.

When I have the 605 connected to 1040STe alone, the printing is fine. Both screen dumps and text print fine. Have not tried a page with both simultaneously. I will hunt down my Pagestream disks very soon.

When the 605 plus a hard drive setup with a ICD ADSCSI+, screen dumps ok and text is readible but looks like extra toner appears randomly around text. The text is readable, but has dots around it like it was double striked with an offset. I am using HD-Driver 8.16 with the ICD interface to std 50pin scsi ibm drive.

Any ideas? suggestions?

Thanks in advance
Rory

The only ones I can find are IDC which is not of much use unless your making
Jaguar video cables, below is a link to the manufactures web site, click on
the distributors section to find a uk/european supplier and if none of the
suppliers stock ask if you can purchase directly if you have not done this
already.

Hi Aly,

Have you spoken to Lyndon ? (hardware.atari.org)

He obviously getting some for the NetUS-Bee. Maybe you can work together to
get
lower pricing or at least use the same supplier if Lyndon's getting them
cheap.

Alan.

Source record: 7174

My opinion:

I'm not up-to-date with the current state of XaAes, but if there are
bugs and list of improvements, then it should has the first priority.

After that, the 68000 port should come.

The ports are next to impossible to get as they are metric pitch, 2mm.

Lyndon

8099. on DHS

Newsgroup: comp.sys.atari.st
Date: 2006-10-02 13:17:33 UTC
From: Rodolphe Czuba <rodolphe.Beurkcaca.spam.czuba@free.fr>
Message-ID: <4521116b$0$303$626a54ce@news.free.fr>
Source record: 7176

A while ago, Gizmo/DHS wrote about using cross development GCC on Mac OS X to create low-level Atari programs.

Now MiKRO/Mystic Bytes has written a new article in a similar subject; how to use GCC 3.3.6 for optimized Atari projects with cross compilation using the Quake Falcon port as reference.

Read the Special Feature #3

8100. on DHS

Newsgroup: comp.sys.atari.st
Date: 2006-10-02 13:19:59 UTC
From: Rodolphe Czuba <rodolphe.Beurkcaca.spam.czuba@free.fr>
Message-ID: <452111fd$0$18708$626a54ce@news.free.fr>
Source record: 7177

MiKRO of Mystic Bytes released an update to The Falcon 060 Quake with
several improvements:

* Fixed bug with setting RGB resolution
* Compiled with gcc-3.3.6 -m68060 -O3 => better performance
* HELP/UNDO keys renamed back to F11/F12 (to make .cfg files happy)
* Added m68k sprite drawing routine from another amiga port => better speed
* Support for another version of shareware edition (thanks to Patrice
Mandin)
* Sound system is now stored and restored completely
* Mouse is handled in more sensible way

Testing the new version, it appears to be a little bit faster, about 3-4%.

It's been a long, long time since I've used one of those, so excuse my forgetfulness. When you say "Driver", do you actually mean the Diablo emulator? I have a feeling that I saw a download for a modified/improved version way, way back.

> I have v1.2 driver for the 804, which works somewhat. Printing problems
> have arisen.

I don't think that there were separate "drivers" for the 804/605.

> When I have the 605 connected to 1040STe alone, the printing is fine.
> Both screen dumps and text print fine. Have not tried a page with both

PageStream. Does that use GDOS to print, or its own driver?

> When the 605 plus a hard drive setup with a ICD ADSCSI+, screen dumps
> ok and text is readible but looks like extra toner appears randomly

TBH, this sounds more like a signal-timing problem? What have you changed recently (ie. since it last worked). Somewhere along the SCSI chain, or maybe something in your Auto folder/CPX/Accs. Also, have you changed the version of HDDriver? Might be worth trying another version.

I can't really offer any other assistance I'm afraid.

No problem at all :-) And thanks to the person who 'phoned you, now
that is REAL support!

> Yes I'm a bit swamped with stuff to do, and it never seems to end.

I know that feeling too :-)

Agreed, in spades :-)

Hi Lyndon,

Yes that does sound plausable, they do look a bit *small*. I'll just check
with a 0.1" board....

AGREED. 2mm.

Ho hum, that's that one out.

Thanks for pointing it out before I got in too deep.

8106. Want to start a BBS again!

Newsgroup: comp.sys.atari.st
Date: 2006-10-03 15:44:49 UTC
From: Tekuryuu <ryuu@tekuryuu.com>
Message-ID: <1159890289.150696.203960@i3g2000cwc.googlegroups.com>
Source record: 7183

Greetings all! I'm new to the group, and have been rebuilding my collection for a little bit now. I finally got my all time favorite machine back, the 800XL. And the best game ever made, Miner 2049er! Now if I could just fine Great American Cross Country Road Race, I'd be in heaven.

I want to start up a BBS again! But I need some help. It's been so long since I ran a BBS, in the early days of WildCat, that I've long since forgotten more than I remember about it. Back when I was doing it, my system was rated #2 in New Jersey!

So... if anyone would be willing to help out, here's what I need:

1. a modem (or a few modii) I want to recreate the whole kit-n-kaboodle, that means everything from the 300 baud acoustic coupled system, up to a "modern" 14.4 and who knows, maybe higher.

2. an SIO2IDE adapter, so i can get some hosting space up.

3. some disk drives, I only have 1 1050 right now.

4. the SIO splitter/switch box so I can get all the equipment connected

5. Some BBS Software. (and any other software too, to host!)

6. Some help setting it up and maintaining it.

7. Does anybody know if there is a way to connect the internet to the system so that I could give high speed access to the same database? I'd like to have message boards and chat rooms and all the fun stuff up on as many different access methods as possible! I can dedicate a domain name if anyone knows how to port it over.

I'll host the system just about all day every day, except when the desire to play Miner 2049er comes around. If someone has another machine that they can throw at the project, I will use that one to host it 24/7/365. I plan to get a VoIP line for the system, in order to keep my costs down. If it takes off enough, maybe I'll put up 2 or 3 lines with the different modems so everyone can have a variety of authentic experiences to show you kids! :)

Any and all help would be most appreciated !!! Donators will get front page mention on the BBS Site, and maybe some special features once it's running.

Please let me know if you can help! I'd really like to see it running live before the end of the year!

Thanks!

Aaron
Ryuu@Tekuryuu.com

incidently, I'm also looking to recreate the same concept on an Apple
IIGS, anyone want to help out on that project?

Hi Tekuryuu!

I think you've got your heart in the right place, but this message in the
wrong one. :)

Post it again in comp.sys.atari.8bit - you'll find some dedicated people
there who are still using 8bit software and hardware to run BBSs. They are
great people.

There are still a few ST BBSs as well, some emulated on other platforms
and some running "real" hardware and software. Check out my sig. :)

Good luck, and once you get up and running, be sure and post a message so
the rest of us can come and visit! Thanks!

>
> Steem is on Mac now?

Regrettably, no. I have used an emulator on OSX before that I thought was STeem, but apparently I am incorrect. With four real Ataris at home, I haven't done much emuation. At work I still occasionally use Gemulator and STeem, but that's running Windows.

> Roger
>

Hey Roger,

Yes, I have recently replaced the battery which is simple with these
carts, no soldering. Just pop in another 3 volt battey which is the size and
shape of a US Quarter (25 cent piece) ;)

There are 8 chips in all. And all have the IDs.
They are as follows...

1 20 pin 74LS373 PC
2 20 pin 74LS374 PC
1 18 pin OKI M5832
1 14 pin 74LS74A
1 16 pin 74LS138
1 14 pin 74LS32 PC
1 14 pin Phillips HEF4013BP

The cartridge and PCB is rather large, same size as a VideoMaster cartridge.

Its rather old, came out around 1986. The software is fairly nice, Two
versions.
One as a ACC. and a .PRG, IIRC.

I still have the manual and original disk software, would be happy to mail
it to you,
if ya want to take a look at it.

Contact me in e-mail and I'll get your address. I also need to place a order.

Thanks,
Barry

> you see more than the first 1GB.

Well, back when I had a STacy, I remember that the hard drive was a bit odd. First of all, the space isn't a standard half-height, although nowadays most drives are less than half-height (third-height)? Secondly, the STacy isn't entirely SCSI compliant -- it will accept most SCSI commands (perhaps SCSI1?), but not all. I wish I could recall the details, but I remember that several drives had to be tried before we got one to work.

8112. Looking for some Atari Things...

Newsgroup: comp.sys.atari.st
Date: 2006-10-05 01:42:02 UTC
From: phantomm <phantomm@bellsouth.net>
Message-ID: <KpZUg.18244$GY5.16230@bignews6.bellsouth.net>
Source record: 7189

I have a Graffiti Genlock by Titan Designs and am
looking for a manual and software called IMPROV PRO
that suppose to come with it.

I do have a disk with a driver for the Genlock,
but have not been able to find the IMPROV
software, which suppose to have Titling and
Animation.

Also, looking for CHROMA Studio 24
which is a early version of Apex Media for
the Atari Falcon and Expose Digitiser.

According to ST Format Issue 60 this software
does exist. There are color photos of it on pages
18 and 19 along with the Expose' and Graffiti Genlock.
It was still being developed, but not sure if it was ever
released. Looks like Apex Media, but one can see
major differences.

As I have a Expose equipped Falcon with Apex Media,
I would like to find this software or any other
that will take advantage of the Expose' even if its not
fully finished.

Another Item I am looking for is a SCREEN EYE Digitiser,
for the Atari Falcon. working or not working. Prefer
working. I don't know alot about this digitiser and there
may have been more than one model. I have heard of
a ScreenEye Plus digitiser. Maybe the same thing.

And interested in most any Atari Falcon related hardware,
upgrades and the like.
Will purchase from overseas any of these items if available.
Also have good Falcon and ST hardware/Software for
possible trade.

Any help is appreciated,
phantomm@bellsouth.net

Yes, the diablo emulator. I used the 'driver' word as a generic term in
the sense the printer doesn't do anything with out it except draw power
from the mains... :)

> > I have v1.2 driver for the 804, which works somewhat. Printing problems

As my memory returns, i think that is correct.

PS may have an Atari Laser driver, AFAIK, I dont think GDOS is
required.

It may be a DMA cable issue, but the distance doesnt change from the
printer. The ICD/HD/HDDriver hangs off the 605 Interface box. I have
not tried to hang the printer off the ICD interface (would only make
the DMA chain longer for the 605)

> I can't really offer any other assistance I'm afraid.

No, thanks a lot!! I appreciate the input. I was wondering if any other Atari folk have a setup that is similiar that may have seen this problem.

> -- François LE COAT

Hi François

I've tried Pack_3D.30.09.2006.zip, and it freezes during boot-up:

NF BOOTSTRAP(../../c/mint/mint.prg -> 0x376ce, 14414898)
NF BOOTSTRAP(0x376ce, 14100696) -> 314202
MMU is disabled
root_descriptors: 0
pointer_descriptors: 0
page_descriptors: 0
memory needed for each MMU tree: 0 byte
Couldn't initialize memory protection. Please run MINTNP.PRG instead.
FATAL ERROR. You must reboot the system.
Reseting weird mouse packet: 280, -249, 0

Best regards
Cyprian
```

Sure. Well, that's available on the 'net as you know. See below for a
tip re the power.

>>> When the 605 plus a hard drive setup with a ICD ADSCSI+, screen dumps
>>> ok and text is readible but looks like extra toner appears randomly

>> TBH, this sounds more like a signal-timing problem?

> not tried to hang the printer off the ICD interface (would only make
> the DMA chain longer for the 605)

As I recall, the manual makes specific where in the chain the SLM
controller box should live. I found that it didn't really make any
difference, but it's worth a try.

>> I can't really offer any other assistance I'm afraid.
>
> No, thanks a lot!! I appreciate the input. I was wondering if any other
> Atari folk have a setup that is similiar that may have seen this
> problem.

Fingers crossed!

BTW, it's quite easy to power the SLM controller box separately from
the printer by
intercepting the +5V and power ground lines to it, and using a
(regulated) wall-wart to power it. Saves power if you're not using the
printer.

Source record: 7196

Specifically, I wrote a compressing ramdisk for MiNT some time in
1992/1993, called "Ydisk" or "Ydisk.xfs". It was not widely distributed
(only to some MiNT "early adopters") and had some patent issues due to
the implementation of LZRW1A that was used (AFAIR).

Does anyone still have the source code for this (fat chance, I know).
If so, I'd really appreciate a copy.

Thanks,
-mjy

8122. Tower malfunction problem - help

Newsgroup: comp.sys.atari.st
Date: 2006-10-05 13:56:06 UTC
From: "Dana @ A-ONE" <dpj@atarinews.org>
Message-ID: <1160056566.391014.249570@i3g2000cwc.googlegroups.com>
Source record: 7099

Well, having used many many Atari systems and related hardware over the years, I realize that things malfunction, and eventually die. <sigh> Well, I had a tower case built many moons ago. That tower housed two hard drives, a CDROM drive, and my Syquest drive. The hard drives died ages ago and were never replaced. However, my Syquest has been a mainstay for my Falcon forever. Well, when I went to work on A-ONE Monday night, I loaded a Syquest cart like I always do, but it didn't power up. Damn, here I was thinking that the drive finally went to Atari heaven - finally - like many of its predecessors. However, I noticed that the power light on my tower was off. Phew, is that all!? I turned the switch only to find that I had no power. Okay, so one of the dogs probably unplugged it. Nope, it was plugged in Nada. Zip. Zilch...

So my question is, before I break down the tower and my study looking for a drive I can use with my Falcon, I have a question. It's been ages since the last time I opened up this tower. Is it likely that there's a fuse that could have finally blown; and that if I find one and replace it, I'll be back in business? Most of my old Atari equipment, including a few drives that were working prior to being packed and stored, are scattered all over my basement in boxes. So if I can find a quick and easy solution, I'd prefer not to have to start digging!!! Any help/advice readily accepted. I know that if there's an answer to my problem, I'll find it here!! TIA!!

-Dana @ A-ONE

Almost certainly a fuse. As to where it is, you'll have to look inside
the case. But first, make sure that the actual plugtop fuse is OK (I
assume that there is one fitted to mains plugs in your country), and
it's always worth trying a new mains lead and checking the wall socket
with something you know works.

Hi Derryck.

Thanks for the suggestion. I threw caution to the wind, figuring that I had nothing to lose. I took the cover off of the tower - what a dusty mess!! <grin> There was no obvious fuse - at least the type that I thought might be there. I did find a "box" that housed the fan and outlet plugs. There appeared to be a fuse inside, but it wasn't what I was expecting (a "regular" fuse of sorts), but appeared to be some connectors attached to "something". I couldn't get at it to get a better look, so I left it alone. I put it all back together, for now.

I've found an old hard drive that I've attached to my Falcon. I can get it to power up, but it must have been a secondary drive that hasn't been set up to boot. So right now I'm going through my old ICD tapes in an attempt to set this drive up to boot, as well as load the software that I need to do what I'd like to do. It's been a long time.....

I'll keep y'all posted. Thanks again!

Well, for the moment, I've found an old hard drive that I hooked up to
the Falcon. I need to do some organizing, but I should be able to do
what I immediately need to do (like get this week's issue of A-ONE
worked on and completed!). One private observation made to me
suggested that the power supply unit on the tower crapped out. We'll
see....

If you have an ethernet to serial converter you could use it. Throughput
would be somewhat limited by the speed of the serial link in the TT. Also
these days probably better using STING....

> my TT to my ethernet hub to which I have a PC running linux and another
> running windows XP? Would this work? Is there an easier solution?
>

There are a couple of solutions that will offer better performance. If you
can find a Falleron or Daynaport SCSI/Ethernet adaptor then you can use the
drivers from http://www.anodynesoftware.com/ethernet/main.htm. A couple of
problems with thsi. First these things seem to be getting rare (I got two
from a "Ham Fest" for four dollars canadian a piece) but try an Ebay search.
Actually I found one...

http://cgi.ebay.co.uk/ws/eBayISAPI.dll?ViewItem&item=320035187217&ssPageName=ADME:B:EF:UK:
11

Secondly they render the floppy drive useless....

The second is an "ethernet" or "EtherASCI" interface. SOme one has made
these (try the archives at groups.google.com) or:-

http://groups.google.com/group/comp.sys.atari.st/browse_frm/thread/eb56a8c603d0d10c/32cefa
cfa857bb87?tvc=1&q=ethernec#32cefacfa857bb87

I'd probably expect to find a glass fuse in clips on the circuit board of the power supply, or a fuse inside a holder, especially if that is attached to the case. That will have a cap that you unscrew to reveal the fuse inside.

If the fuse proves OK, then you could probably just replace the supply with one from another PC.

Derryck,

I also expected to find a glass fuse attached somewhere inside, but I
didn't see one during my initial search.. Now that I've located and
set up a back-up to my system, I'll have some time (and patience!) to
pull that tower apart again and search more thoroughly. Thanks.

I've had it installed for a while, but never announced it.

If you'd like to help with the HighWire documentation, We now have a
Wiki!

Very little has been setup on the wiki, which might be good for a fresh
start on the documentation.

Check it out at http://highwire.atari-users.net/wiki

Hi,

This is the latest news of my PCI story, new screen captures works with
a new accessory JpegSnap...

http://perso.orange.fr/didierm/ct60/ctpci-e.htm

The archive is also updated (always in version alpha 1.04) for the CT60
and the Coldfire board M5484LITE. There are also the sources of Eiffel
2.0, and JpegSnap.
About the CT60, the TOS, the CT60CONF.CPX and FLASH060 are updated for a
new type of flash on the next 20 CT63.

Regards,

Didier.

Hi,

The Pack_3D was updated today at <http://ebmodel3.atari.org/Pack_3D/>
because a mistake was done when packaging the Cygwin (Windows) part.

We do apologize for the disturb that occurred for some users.

In facts, the executable was corresponding to an outdated version.
We thank people that are supporting our work, and reported promptly.

We all wish that it will never happen again !

Regards,

Hi,

Thanks for the suggestion, I actually can across this site before my
inquiry. I do have the necessary software and hardware other than the
Daynaport. Thanks for the ebay link but I think I will search the used
Mac equipment sites in Canada before going with a Uk provider. Can't say
I am keen on losing floppy drive support. I have come across one other
Google link where an experienced used couldn't get this setup to work. I
am not looking for speed but easy of use due to my limited tech
abilities, I have mainly email and perhaps occasional use of CAB in mind.

Thanks again.

If you're using a Falcon, the floppy *will* be essentially inaccessible
while the Daynaport is active. This is because the driver has to
constantly poll the SCSI port to see if a packet has arrived, and the
SCSI port on the Falcon shares internal hardware with the floppy drive.
When you're not online you can just disable STinG and the problem will
go away. For other systems it's not a real problem.

I know of two problems with earlier versions of the driver:
. you needed to set a permanent (static) ARP connection in the
system(s) that wanted to talk to the SCSI/Link
. it crashed with HDDRIVER v8.xx.
Both these bugs are now fixed.

If you can't find any SCSI/Link hardware, email me.

Roger

Hello,

Well... there must be a problem then : this link is unreacheable with
HighWire. Nothing displayed after 5 minutes at 8 Mb/s. Just ï¿½connecting
to...ï¿½ and the adress of the page.
I tried with CAB 2.8 : the page displayed just one second later.
Tried with HighWire again : still the same, had to break after 15
minutes stating ï¿½Connecting to...ï¿½.
A website that can't be accessed with the browser is is related to...
it would be funny, if this browser didn't pretend to be a must!
Any chance this can be fixed quickly ?

Regards,

Jean-Luc

My CT60 is packed up for moving (selling my house) so, I tested under
Magic PC and it worked.
Only one issue was the menu displayed on the bottom left and not the
bottom top. This is using the last official release HighWire 0.3.0.

Anyone else have a similar issue like Jean-Luc?

Indeed, no access with HighWire 0.3.0. However, version 0.3.1 beta4
(CVS) accesses the wiki fine. I guess it's time for a new release...

And HW 0.3.0 (Mintnet.ovl) gives me the same problem. I can't get in.

Well I got TOS running on the coldfire too, but no video or keyboard and
mouse due to no eiffel or Radeon card :-P I have to try to find a
replacement for my unworkable Radeon 7000 Mac edition.

Thanks,
Mark

Seems so. I am using 0.3.1 beta 3 and it loads the wiki without probs
too.

A Radeon 9xxx PCI normally works, but you need x86 BIOS.
For the mouse, I have build a serial mouse driver for Olivier (if Eiffel
is not found on the CAN network).

This is my latest news, finally CompactFlash works !

The base address is 0x5A001800 on the LogicLoader, under TOS it's
0xAA001800 (the CPLD use 16 MB).

There are some differences with the IDE Falcon, 1st is bytes are
swapped, this is the list of registers on the Falcon:

```
ATA_DATA 0xFFF00000
ATA_ERROR_REGISTER 0xFFF00005
ATA_SECTOR_COUNT 0xFFF00009
ATA_SECTOR_NUM 0xFFF0000D // LBA bits 0-7
ATA_CYLINDER_LOW 0xFFF00011 // LBA bits 7-15
ATA_CYLINDER_HIGH 0xFFF00015 // LBA bits 16-23
ATA_DEVICE_HEAD 0xFFF00019 // LBA bits 24-27
ATA_STATUS_COMMAND 0xFFF0001D
```

ATA_CONTROL_DEVICE 0xFFF00039

On the Coldfire FireEngine module, after seaching lot of hours I have
found:

COMPACTFLASH_CIS COMPACTFLASH_BASE
COMPACTFLASH_CONFIG (COMPACTFLASH_BASE+0x200)
ATA_ERROR_REGISTER (COMPACTFLASH_BASE+0x180C)
ATA_SECTOR_COUNT (COMPACTFLASH_BASE+0x1803)
ATA_SECTOR_NUM (COMPACTFLASH_BASE+0x1802) // LBA bits 0-7
ATA_CYLINDER_LOW (COMPACTFLASH_BASE+0x1805) // LBA bits 7-15
ATA_CYLINDER_HIGH (COMPACTFLASH_BASE+0x1804) // LBA bits 16-23
ATA_DEVICE_HEAD (COMPACTFLASH_BASE+0x1807) // LBA bits 24-27
ATA_STATUS_COMMAND (COMPACTFLASH_BASE+0x1806)
ATA_DATA (COMPACTFLASH_BASE+0x1808)
ATA_CONTROL_DEVICE (COMPACTFLASH_BASE+0x180F)

=> bytes are wapped for read/write data in 16 bits (Falcon use 32 bits
at 0xFFF00000 but step of registers is 4 bytes.

But the main problem was:

Byte writing on odd address register not works.
Byte writing on even address works but write also on odd address.
So now I use word access for writing IDE registers:
ATA_SECTOR_NUM/ATA_SECTOR_COUNT
ATA_CYLINDER_HIGH/ATA_CYLINDER_LOW
ATA_STATUS_COMMAND/ATA_DEVICE_HEAD
Else for reading byte /word access works.

Maybe it's normal, maybe it's a CPLD bug, maybe chip select programming
on Coldfire are bad (finally I use the same values than LogicLoader
excepted the base address).

=> it's totally incompatible with Atari disk drivers (it's impossible to
patch without rewriting), so now I must create a little driver for read
the 1st partition, it's not more difficult than a ram-disk used actually
for tftp transfer.

Thanks a lot for this Coldfire story :-))

I don't think at this point that it's very necessary to separate the groups. not like we're burdgeoning with traffic or anything :-P Yes, the coldfire news is exciting indeed! With CF we can use 2GB CF cards which are very cheap these days!

Thanks,
Mark

Hi Didier!

Hats down, this sounds like very interesting and important experiment.

While looking at your Kronos bench it just strucks me that the CF is only 1/3 faster in integers and equal in almost all other CPU characteristics with CT060. Considering the incompatibilities and other aspects when such a machine would enter the mainstrem I would vote to rather focus on some faster CPUs. What is your point of view on this? What would be the projected 'production' CPU frequency and CPU performance gain on that?

Again, I admire what you can do with the good'n old TOS.

Best Regards

STanda

I wonder how much CF68Klib slows it down. Maybe native compiled CF code
will be faster.
Thanks,
Mark

> What would be the projected 'production' CPU frequency and CPU
> performance gain on that?

My point of view:

1) As you can see on the Kronos bench under *emulation*, the CF perf.
are almost the same that a CT60@100mhz... Native CF app. will be a lot
faster.

2) A synthetic benchmark measures the raw power while an application
uses the CPU, the GFX subsystem and the disk access.
Therefore, I'm sure that with the CF, we will get a computer up to 2
times faster that a Falcon with a 060@100(even under emulation).

3) Don't forget that the CF owns vectorial instructions(MAC) and at 200
mhz, I think that it's enough to decode the DVD, Divx, etc...

4) Didier almost has finished the work, it is too late to vote ;-)

> Again, I admire what you can do with the good'n old TOS.

We are all dwarfs compared to him :-P

Correct, but is the point to have 2x times faster incompatible machine?
I am just wondering...

> 3) Don't forget that the CF owns vectorial instructions(MAC) and at 200

Another incompatibility, right. Another scatterign of the few people
still playing with the platform.

> 4) Didier almost has finished the work, it is too late to vote ;-)

Finished an experiment in my eyes. Remember the board he is using is
very limited and probably would need to be replaced with something
else. To me it is about the adoption. Will see how many of Atarians
will switch and when.

Well, we must be kind with the evolution of the new CF machine.
You know that it is less than one year old developing, and that
it seems there's a single creator ... While the VM that we all
know is widely diffused, with a strong kernel of motivated
creators, and almost exists since 10 years.

Even if all these efforts seem to be vain, we must let it be ...
Didier is a surprisingly courageous guy. That never been done !

Howdy,

> Correct, but is the point to have 2x times faster incompatible machine?
> I am just wondering...

Hmm... I'm pretty sure that people think the CT60 is pretty useful even
if lots of old stuff refuses to run on it. The speed makes it possible
to do stuff that we could only dream of before, and how can that be
bad?

> > 3) Don't forget that the CF owns vectorial instructions(MAC) and at 200
> > mhz, I think that it's enough to decode the DVD, Divx, etc...
> Another incompatibility, right.

Is it a bad idea to use the DSP in the falcon, or to take advantage of
030/040/060 instructions to gain speed? Is it a bad idea to take
advantage of new graphics hardware, or use natfeats in Aranym?

Sure, in theory, it causes lots of compatibility problems. In practice
however - the apps that need these new instructions are written with a
faster machine in mind, so they wouldn't be useful on the older machine
anyway. It's pretty logical. You won't try to play DiVX:es on the ST
anyway.

>Another scatterign of the few people still playing with the platform.

Personally, I wouldn't be using the platform if it wasn't for the CT60.
I don't think I'm the only one. New developments *keeps* people on the
platform.

Don't take me wrong I am not saying it is 'bad'. I am just saying that
perhaps we might come up with HW (or whatever) eventually more
profitable for the whole community which would be worth putting effort
into.

As long as you enable other machines to use the same interface for the
functionality - i.e. provide a clean OS driver for each such thing then
it cannot be bad of course.

> Sure, in theory, it causes lots of compatibility problems. In practice

Right, it causes rather scattering of already quite scarse community.

> however - the apps that need these new instructions are written with a
> faster machine in mind, so they wouldn't be useful on the older machine

Well you could in case the author of the SW provides a reasonable
interface
which you could implement on ST utilizing some HW acceleration or
something.

> >Another scatterign of the few people still playing with the platform.
>
> Personally, I wouldn't be using the platform if it wasn't for the CT60.

> I don't think I'm the only one. New developments *keeps* people on the

I know. But that is mostly because CT60 provides so HIGH compatibility.
Otherwise people would think it is not really that useful as it cannot
run this or that.

Wasn't there a Atari-specific problem with drives (or partitions) bigger
1GB? They could't adress such big storage-devices IIRC.

I'm throwing all of my stuff in the bin. No one wants it, and those that do
expect to get whatever for 1p and for it to be gold plated. :-(

I guess people think because it's old technology it should be cheap or
given away?

I've got a virtually unused SONY MD recorder with dozens of unopened
disks, no sooner than I had bought it, affordable CD recorders started
coming onstream, so I boxed the MD away and went CD!

I suppose I could put it on eBay or whatever, but I doubt if I would get
much for it.

In that case I probably would just ditch it, but part of me keeps
thinking I should try and get something back on it!

Not an easy one, I suppose I would rather sell it for peanuts and at
least not have the sadness of dumping a perfectly good machine.

Oh well...

I look at it this way, I would rather sell for 1p (+ postage of
course)and hopefully that old bit of kit will carry on geting used by
someone, than throw it away.
Or even donate it to the local jumble sale, anything but throw it, you
only do that with PC stuff :-)

I think the same, id rather sell it for a quid than chuck it out, all the
simms could fix a heck of a lot of STE's, in fact most of them have come out
of STE's which I have serviced over the years, they all have 4MB now, hence
rather a lot of 256K simms :P

Also have 3 upgraded machines still, I know they were all stripped down,
cleaned etc, 1.44kit fitted, 1MB or more, I think they are STFM's, one has
4MB... if anyone is interested then let me know, I used to sell them for
£100 though like everything else demand fell, I'll get them on ebay soon,
Ebay deleted my auctions cos I said there may be a 5% paypal charge, truth

is sometimes there is and I have no idea why, so I put that in cos people were moaning that it wasn't listed in the auction that they get chaged, now Ebay moan, you can't bloody do right for doing wrong!! Thats 3 hours of my time wasted now, waiting for Ebay to reply to my email telling them what I thought of all that, no doubt I will have to spend another 3 hours relisting the stuff again, will also have to spend a day looking around paypal settings to try and figure out they people get charged 5%, I think my webstore used to charge 5% but thats nothing to do with Ebay.. oh the joys of trying to clear ya "junk" out of the way, should just chuck it all in the bin like Aly and have donw with it :-(

rant over :)

Hi all,

Following the interview with XaAES founder Craig Graham, The Unofficial XaAES Page have now republished an interview with Henk Robbers. This article was originally written by Jo van de Gruiter for the online magazine MyAtari.net back in 2003. Thanks to Matt Bacon for granting us permission to reuse this nice interview.

Read the interview here: http://xaaes.atariforge.net

Cross-posted to:
comp.sys.atari.8bit,comp.sys.atari.st,rec.games.video.atari,rec.games.video.classic,rec.games.video.marketplace,pdx.forsale

I'm done updating my catalogs with NEW information! My software and books catalogs are now 80 columns except for hardware which are still 38 columns. I no longer have catalog named NEWINBOX.TXT... New items have been moved into corresponding catalogs. For instance ST_SOFT.TXT Now has both USED & NEW ST Software. New items are listed with a NIB by price. NIB=NEW in BOX!

FREE Catalogs for Used & New Classic Atari 8 Bit & ST Computer lines plus Atari Jaguar Games and Consoles! View Catalogs on-line, Download them or Feel free to Request catalogs by E-Mail. Really, it's not an inconvenience. I ask that you specify 8 Bit, ST and/or Atari Jaguar! Or all 3! Then I'll send them to you by E-Mail. Let me know if I can/cant attach files to your E-Mail. Atari@aracnet.com or call (503)256-9974!

http://BensCatalogs.Atari.org FREE ATARI CATALOGS!
http://www.aracnet.com/~atari/specials.htm ATARI SALES DETAILS!

I've got a fast turnaround rate. Usually, Once I receive payment your order goes out the same day. Customers love the speedy service! I have lots of Atari SoftWare & Books. Which I can send by Media Mail Rate!

Please Direct all Replies Through E-Mail to: BenSells@Atari.org or Atari@aracnet.com. If you can't reach me, see my info at the Bottom!

Atari Jaguar, 8 Bit and ST Games/Software, Hardware/Accessories & References/ Books. FREE Catalogs on Ben's Domain at http://BensCatalogs.Atari.org or at http://BenSells.Atari.org Catalogs can be attached to,Requested by & Received Through E-Mail at Atari@aracnet.com or BenSells@Atari.org and Please Specify Atari 8 Bit, ST, Jaguar and/or all 3! Or Call Ben anytime at (503)256-9974!!!

Yes, this is the problem with eBay and their charges. When you're running a
business, the customer pays if they want to use a credit card. And equally,
a sound business model will charge 5% if someone wants to use PayPal.

Well, PayPal have successfully screwed up my Verified Premier Account in
their last server update, such that a few thousand accounts are being
reported to eBay as Unverified, hence, you can't sell with Buy It Now.
PayPal are by far the most apathetic company I've ever come across.
Repeatedly they said it was eBay, and eBay said it was PayPal, and this went

on for a month. And then PayPal did a security check on me just to add insult to injury. I told them to PISS OFF in large letters, and a few other creative digs written in beaurocratic style. And then to finally take the biscuit, they actually wrote and thanked me for telling them to piss off. Talk about well and truly winding the customer up. If it's not on their screens the problem doesn't exist. If they can reply to quickly close the ticket, they will. Needless to say I now know first hand why the www.paypalsucks.com site exists.

And now onto this selling stuff for 1p rather than putting it into the bin. You GIVE stuff to people for NOTHING, and still they complain. Chris had warned me of this a few years back and I just thought yeah yeah! And he was right. Out there, aside from comp.sys.atari.st, they're not like you and me. They're people who expect to just plug in an Atari ST and see it run, just like they do with their Windows XP operating system.

The Atari arena is changing. It's being taken over by wannabees with very little technical or electrical common sense, who instead of bettering themselves and learning why things happen, they blame other people for their misfortune.

that's my rant for today :)

aly

Some basic systems (520STF) have 9.99 EUR bids on ebay.fr. So I guess your
upgraded kits are certainly worth much more.

Don't give up ! Make sure the casual visitor sees what extras are included on
top of a basic system (not sure these will appeal to the ordinary retro
gamer, though).

Just a thought then Aly and Chris, maybe you could consider asking
people you could trust, like people in this newgroup or atari forums
before ebaying stuff?

Hi Jerome,

Thanks :-) Believe it or not I suffer from stress. So does Chris :-)

We do this every few months, throw our toys out of the pram. Well. It adds
to a well rounded Atari community that's for sure.

Over the years I have given away loads of Atari and audio stuff for a fraction of what I paid for them, mainly because I needed the space for a growing family. I was glad that whoever bought or took the stuff away had some use from them.

I look at my Falcon and wonder what I should do with it now. It probably would get some use if it was part of a network, but it needs a new mouse, a new monitor, network hardware etc etc. Then where do I exactly put it? I've got limited deskspace, so that would be a major problem!

> Or even donate it to the local jumble sale, anything but throw it, you
> only do that with PC stuff :-)

What do I do with a 133 Pentium with 32Mb memory and the first version of Win98! Not even a network card or USB connection!

Again, is it really worth keeping or spending money on it?

Mmm...

>
There is a TOS specific limitation regarding partition size. Early STs
had a limit of 256 MB per partition. Most other TOS versions have a
limit of 512 MB per partition, except for the Falcon (4.0x) TOS which
can access 1 GB per partition. MiNT (a multitasking TOS replacement)
can go to the TB range. With 14 partitions possible, your ST Book can
access 7 GB total via its built-in operating system.

I have a old P133 in my workshop, gets used mostly for DOS stuff, it also
has 98 on it, the only thing installed is winamp, I use it as a audio source
for testing amplifiers, old crap 12" monitor, winamp takes up most of the
screen on it, I program chips in DOS, serial ports get used now n then for
other hardware, does not matter if I blow it up as it has no value, fixing
it is easy as the tech is really old, hence cheap.. and should it die a
death then I have a good sturdy door stop... I guess it depends what you
want to do with the stuff and how you want to use it.. some people spend a
fortune in vintage cars, all depends on a lot of things...

rant over :)

yep, Ebay is in the list of bad books, they replied to my request of relisting my pages by pasting an exact copy of what they already told me in the first place, and I had to wait over 2 days for that, so ive pasted exactly what I put in my reply and posted it back to them, seesh. I have about 200quids worth of electronic modules here which I had listed, ive spent almost a full day so far listing the stuff, now a battle with Ebay.. for all the trouble it causes just makes more sence to bin anything you dont want these days. Even if its sold then people will probably moan, which is more time, and hey ive even given stuff away before now and had a guy try and sue me becasue it wasn't upto spec.. By the time Ebay and Paypal have had thier cash cut for doing nothing at all, im left out of pocket and out of hours of my time... I refuse to chuck away stuff though that I paid good cash for, even that ST's ive upgraded, a lot of time and care went into it all, just aint right just to bin a weeks worth of my time.. oh well..

I really don't know whats up with people in the world today, everyone is just looking for a excuss to moan or give someone trouble for no reason at all. Some people in the world have beter things to do, geez....

Ive decided to take up drinking now anyways, im off out 2moz night and don't plan to be until monday, pub arguments are always fun since most people lead such simple lives. Would like to see some people run my life for a bit then they really would have something to complain about :)

Nice rant!

(I see the P133 as unusable for me.... every software needing a faster CPU than 386/25 is for my actually used Pentium ~1000MHz, the other is covered with my 386/25 ultra silent, with Flash-IDE 256MB)

Best Regards,

Daniel Mandic

> into.

CF has some advantages. Assembler coders will have a familiar
environment, and as far as I know, it's possible to produce code which
works on both 68k and CF, or at least code which can be emulated in the
same manner as on the 060 (i.e. not interpreted or recompiled, but
handled through the illegal instruction vector).

> As long as you enable other machines to use the same interface for the
> functionality - i.e. provide a clean OS driver for each such thing then
> it cannot be bad of course.

I couldn't agree more. Most compatibility problems are caused by lack
of good OS functionality and hardware-banging code. This can't be
accounted for without complete emulation, and not everyone likes that
idea.

> Right, it causes rather scattering of already quite scarse community.

No it doesn't. If it runs freemint, and can be made compatible enough,
everyone will benefit from it, because it could keep people on the
plaftorm.

> Well you could in case the author of the SW provides a reasonable
> interface
> which you could implement on ST utilizing some HW acceleration or
> something.

E.g. an XDD for freemint. I agree.

> I know. But that is mostly because CT60 provides so HIGH compatibility.
> Otherwise people would think it is not really that useful as it cannot
> run this or that.

90% of all ST games refuse to run in 060-mode, and perhaps something
like 50% works in 030-mode. That's not high.

... *but* it does run freemint. And it flies. A clone with some more
juice can run CaSTaway or Hatari. CaSTaway runs at aprox. 70% on a
100Mhz 060.

I can't find any reference on the Crazy Dots Manual I've about J5 but
there is a picture in the leaflet. I've make a scan of it which you
download from this address:
<URL:http://users.telenet.be/tos4ever/downloads/crazy_dots-jumper.gif>
It's a 1,1 MB file.

If you like I can scan the whole German manual for you.

TTFN,
Martin

ST Internals had the TOS 1.00 ROM partially disassembled. It had the
XBIOS and BIOS routines, as well as the support routines used during the
actual booting process, but the disassembly didn't include any of the
GEMDOS, VDI, or the AES code.

Hi,

A while ago I got the Atari STe of a friend who had passed away. Now
with this Atari, a game called Xchess was included (original!) by Xfun
(a couple of organisations including Atari Benelux). I wanted to give
the game a try for old time sake but unfortunately the disk is no
longer readable.
Can someone help me obtaining a working version of this game?

Thank you.

folkert@vanheusden.com

p.s. I'm collecting chess-programs (original media), so if any of you
wants to sell his chess-game to me, please contact me!

Thanks. Lots of interesting stuff there.

I found the source code for TOS v4.04, which unzips to a massive 76 MB.
Looks a mix of assembly, Pascal and C.

It looks a big job just to get all the software to recreate the ROM images,
let alone to make mods to it.

Sigh.

I was wanting to mod the code to use PS/2 keyboards and mice codes directly.
It now looks simpler to use a microcontroller to interpret codes.

Today, I came across a hardware mod to replace the floppy disc form the Atari ST or an Amiga

It's not for the casual soldering-iron wielder, though, and it would be more practical to be able to just plug a USB flash disk. Still, it's impressive.

Hmmmm, I cannot understand. USB flash disk? Flash disks!?

Would you take a 76CM/sec Tape Recorder or an USB-MP3 Recorder for
recording, let's say, an Orchestra?

Best Regards,

Daniel Mandic

Just a side note to our e-mail subscribers.....there have beeb problems
this week with the Atari-Users.net/A-ONE server, so our mailing this
week has not been successful. Please find this week's issue at our
address below. We are working on the problem, and will mail out the
issue again as soon as we can. Thanks.

It's also called USB keys (at least in french, everyone uses the term "cli¿½
USB")

True, but it is not a trivial price.

It costs more than what I paid for my Atari STe motherboard.

More importantly, it is entirely someone else's product which I can't
integrate into my own.

I've since compared the ST keyboard with the PS/2 standard and there is a
lot of similarity I can exploit. Certainly looks like I can get it talking
to a keyboard fairly easily. Merging traffic with a mouse will definitely be
harder, but for now a keyboard should be able to type in some basic sanity
checks.

Some years ago I asked if an ST emulator could be made for the Milan
to allow it to run ST games but no-one could help. Opinion was that
it would be to slow but I pointed out that it wouldn't be emulating
a 68000 in the same way as when emulators run on other platforms.

Such work may have been very useful for progressing to CF and/or PPC
machines.

No, it is not an USB flash disk. It is something like SIO2PC on 800XL.
You don't need to write disk images back to floppies, but load them in
a PC and send through this interface as if a floppy was inserted into
your ST.
Great hardware. I hardly wait to buy one (or build if possible) !

An usb-mp3 recorder, *no* ; a 76cm/s tape recorder, *yes* : the highest
the speed, the best the quality!

Hi Jean-Luc!

Well, Orchestra was a difficult example, but Orchestra Sound is played (amplified) back with 100,000Hz.

A capable Sourcedevice presupposed. Some Vinyl Player reach upto 70,000Hz. And the 76CM/s Tape can support such high frequencies.

Not to mention the 78CM/s machine, in the fifties/sixties. One of my best CD's (recording quality) have been mastered so, or that is to say, recorded at that time. ~1956 Orchestra

Kind Regards,

Daniel Mandic

This makes no sense. The human ear can hear only upto ~20khz. But this
isn't what you meant, is it?

There is also some brief material in English posted at
http://www.torlus.com/index.php?2006/09/16/191-floppy-drive-emulator

A recent posting there says "we're thinking about building and selling
proper boards, so stay tuned..." so perhaps this will be available for
purchase at some point soon.

As a Sinus, yes. (I hear upto ~18,000Hz sinus)

The Limit, set by Music-technically meanings, is about 30,000HZ

But you lose headroom when cutting at 20kHz. In other words, imagine a
wonder-box which can cut all frequencies in an Orchestra Chamber, over
20kHz... would you hear the difference ?

;)

Harmonics (or resonant harmonics), I think you mean Dan? I can tell the difference between a digital and an analogue recording. Strings are a dead give away, they just don't sound natural when recorded digitally. Some digital recordings are better than others mind you. Classical music is always easier to pick than rock or doff, doff. Alot has to do with compression too. Most top 40 stuff is compressed to crap house. Besides, digital is an approximation of a sine wave, not an 100% accurate reproduction of it.

Still not sure what this has to do with USB drives tho? In a purely digital realm I would bank on USB over disc. Even DVD and CD (burnt) has a limited life span and magnetic media can be pretty unreliable over extended periods.

Mark

Take it as you wish dear Mark.
One Double Density Floppy in an ATARI ST/TT/Falcon/etc. can whack any
MP3 Recorder :). Well tempered Sound Hardware (MIDI) presumed.

Why USB when I can connect various Harddrive systems to a ST/TT etc.?
Maybe for a Hades, Milan and other fast 040, or better, 060 Ataris,
IMHO. GfX Card, Sound Card etc...

Kind regards,

Daniel Mandic

8225. UK ebay shop finally up

http://stores.ebay.co.uk/exxos-surplus-electronics

some atari items to clear in there, among other things. Everything is open to offers so don't be shy!!! I really need to clear out all the listed stuff ASAP as its all taking up too much room.

I've listed the last sets of 1.44 upgrades cheap, also open to offers, Will see what else I have I can list.

I have a Atari monitor, mono, I forget the number, will have to check if anyone is interested. Have piles of ST spares. Trying to clear it all out!

http://www.cps-electronics.co.uk/site/stock.pdf check the list out there, everything is to clear, most is listed on Ebay now under offers. Ignore the prices in that pdf, I have no idea how many of things are in stock , so just ask if interested. I'm listing 150 capacitors on ebay for 99p so you can see im serious about clearing out all this stuff!!

Everything is up for the next 30 days in the store, any questions just ask.

Chris

If you want full 68000 compatibility, you'll need to emulate the CPU just as you would need on other platforms. It may be possible to make some shortcuts if one implements the 68k emulator in 68k assembly, but you still need to emulate the rest of the system - and for compatibility reasons that would probably need to be cycle accurate or at least scanline accurate. Speed could be "usable" on the CT60, maybe on the Hades, but definitely not on the Milan. I hope someone proves me wrong, but this is my personal conclusion after having experimented with CaSTaway on the CT60.

Hi Chris. I've got a couple of questions, if you don't mind.

1. The HD module "kit" is just that, and is not pre-assembled, ready to be
installed?

2. Would you ship to the US?

Thanks.

HI Ron,

The kit is a kit, its shown in the image. Theres not much to it just takes
a little bit of time..

I can ship anywhere in the world any service you like.

BTW, if anyone wants to contact me you can mail me at

exxos_uk (AT) yahoo (dot) (co) (dot) (uk)

Or you can contact me at www.cps-electronics.co.uk via the email form, all
mail goes to my account now anyway.

Just listed a few more items also, got a bit bored, so will carry on
tomorrow!

cheers,
chris

I'v just discovered the Eiffel3 website where I can download a hex image of the software for the PIC16F876. I think I can stick this in a PIC16F877. It is a bigger physical footprint than the S-DIP28, but it will do to get me going.

Hi

my Atari collection is up for sale! I haven't touched it in years so no guarantees but it did all work last time I used it.

There are two conditions:
1 - you collect and,
2 - you take everything !

Email me with firm offers to jsb - at - jsbrl - dot - f9 - dot - co - dot - uk

Here goes:

falcon in CLAB MKX case 14M RAM + AB040
falcon mostly rehoused into tower, 14M RAM
spare AB040 card
2 tt-style keyboards
best trackball
external scsi cases
PowerUp2
Eclipse PCI adapter + video card
scsi zip drive
EtherNEC

loads of software(with manuals + key where appropriate) including
N.AES
XBoot
Lattice C5.6
Devpac 3
Diamond Back 2/3
Imagecopy 3.5
CDBackup
CAB 2.5
HD Driver 7
Papyrus 5
Kobold
NVDI
Quill
Tabby
Diamond Edge
NeoDesk 3/4
NeoDesk CLI
Obsession
Substation
Extendos Gold

CDWriter+
Geneva
TrueImage
TruePaint
HisoftC Interpreter

Books:
Modern Atari System Software
The Atari Compendium
Programming the 68000
Computes Technical Reference Guide Volumes 1, 2 & 3

+ more - I got bored at this point ;-)

Well I have a Milan60 so that is a little quicker. Since I've never had a PC
I lost track of how many emulators there are. It's a pity that none was every
compiled for the Milan.

Could you elaborate that further? What exactly do you mean by "passed
directly"?

CaSTaway can be adapted to work on the Milan, and Hatari uses SDL so
you could try compiling it with Patrice's SDL-port.

8240. fVDI/AES 4.1 incompatibility?

Newsgroup: comp.sys.atari.st
Date: 2006-10-23 14:07:29 UTC
From: Philipp Reichmuth <reichmuth@web.de.invalid>
Message-ID: <4q40l1Fl3osbU1@individual.net>
Source record: 6967

Hi,

I'm currently experimenting with ARAnyM 0.9.4ß. The stock setup (EmuTOS, FreeMiNT 1.16-cur, fVDI, XaAES) is running fine.

However, I'm trying to run the original AES 4 instead (for a particular nostalgic reason) and can't get it to cooperate with fVDI; however without fVDI it's dead slow. (It's supposed to be slow, but not THIS slow.) I've been trying under TOS 4.04 with a floppy disk image with MultiTOS, under TOS 4.04 with FreeMiNT and under EmuTOS with FreeMiNT, so I guess the underlying layers don't matter too much. Symptoms are the same: fVDI loads, the resolution changes, I get a black ARAnyM screen (or white at color depths <= 4) with a mouse cursor and nothing happens. All three configurations work fine with XaAES (after the resolution change, black screen for a second or so and then the XaAES screen.)

Is there a known incompatibility between fVDI and AES 4.1? Does this happen on a Falcon, too?

Philipp

Source record: 6968

Hi Philipp,

The work has already been done for you :)

In order to boot ARAnyM under plain TOS4.04, you need a disk
image. A disk image was published with AFROS distribution, but
AFROS is not anymore a disk image (but a diskless configuration)
so it is not suitable to boot TOS4.04. The reason is that TOS
cannot be bootstrapped.

I maintain since a long period, a disk image that used to be
compatible with AFROS, and that is a disk bootable configuration
handling both TOS or EmuTOS. It is a 8Mb image that contains
freeMiNT+XaAES plus a variety of required utilities and applications
that I still use on my own Hades060, proved working safe and UTD.

Minimal required system at <http://eureka.atari.org/xa-my-aes.zip>

There's not any known incompatibility between fVDI and AES 4.1.

Please let us know about your experience.

I know. I was booting TOS 4.04 from a floppy image, loading BetaDOS and the host filesystem driver from there and then doing most of the rest via the host filesystem. It works, even though it's a bit of a hack.

> Minimal required system at <http://eureka.atari.org/xa-my-aes.zip>

Thanks for the link.

>> Is there a known incompatibility between fVDI and AES 4.1? Does this
>> happen on a Falcon, too?
>
> There's not any known incompatibility between fVDI and AES 4.1.

OK. Your configuration will actually load AES 4.1. However, with a plain disk image containing only MultiTOS and fVDI I get hangs, too. I guess it has something to do with the MiNT version. I'll tinker around a little bit and see how it goes, maybe I can isolate the problem.

Philipp

Not really. You can execute single instructions directly. You have to interpret them The only time you can by-pass emulation is when you want to have a VM on a 68K10/20/30 as you can run the code in real problem state, and any instructions that need to be emulated program check. Thats why storing the status word generates a check. So you can fake the supervisor mode bit being set...

Well a 68000 prg being run under an emulator on an Intel has to emulate
every instruction but I would have thought that quite a lot of 68000 CPU
instructions could run on a 68040/060 without having to emulate them.

I can see how the other parts of the ST hardware would have to be emulated
but not the 68000 itself.

It was just an idea that I thought might allow the ST emulator to run quicker
on M68k hardware.

>> Well I have a Milan60 so that is a little quicker. Since I've never had a PC

I've only had GCC on the Milan for a short time and not found much that compiles
straight out of the bag. I am still learning how to do basic stuff. Over the
years I've written code in practically every language but don't really like C
which doesn't help. That's why I try to help where I can by testing stuff and
giving feedback to the developers.

Peter

You still need to handle stuff like registers, interrupts, traps, flags
etc. In effect, this means having a "separate" virtual machine. You'll
need some support code for each emulated (or whatever) instruction to
handle this. In effect - emulation.

> I can see how the other parts of the ST hardware would have to be emulated
> but not the 68000 itself.
> It was just an idea that I thought might allow the ST emulator to run quicker
> on M68k hardware.

Hey, I agree - it *can* be optimized on 68k hardware - but you can't
run stuff natively and still provide sufficient emulation of the rest
of the machine on the same time.
68k macs can be emulated that way, but to my experience the ST can't
due to the OS and the way games always access the hardware directly.

Install the SDL library and try some SDL-based stuff. Much of it works
right away, other stuff needs some slight alterations. (Well, if SDL
works on the Milan, that is. Does Doom run properly on the Milan? It
doesn't work perfectly on the Hades yet)

Hi Philipp!

The TOS 4.04 loaded by aranym is patched before used in ARAnyM for
68040 compatibility and more. I am not sure that the AES 4.1 as
distributed with MultiTOS is 040 safe - most probably it is not.

In case you would like to run nostagic apps I would recommend trying
Hatari instead as that one is under way to get full cycle accurate
Falcon emulation http://hatari.sf.net .

Best Regards

STanda

Very very interesting.

I did a quick count of the list and there are 214 lines saying
"converted", and 224 lines saying "unconverted", so IMO it's hardly
90%.

Still, very very interesting all the same.

So, you should contact the author Philippe Reverdy on this page and ask to him how/why 90% he told.

I just put the link here because I think this software is interesting...

```
Thanks Rodolphe for the link

I only meant that 90% of my old KIK3D, KIKBOURS and KIKTRIS applications may
be converted with the GFA to java converter.
In fact Coda is right, I still need to work a lot for covering the whole GFA
functions... If you need a conversion on a specific function, just ask me,
I'll do it, if possible...

Thanks

Philippe

If this is exactly the same syntax, this should work...
Let me know if you try...

But as Coda said, only maybe 50% of keywords / syntaxes are currently converted...

From: toothy_grin@theglaholts.net
Message-ID: <JNX%g.135$7N4.9@newsfe02.lga>
Source record: 6983

Hey, all.

This is going to sound quite odd and weird, but I'm looking for
the source code for any Atari ST ramdisk utility. I don't care
which one, how good it is/was, or whatever. I just wand the code
for a ram disk (Atari ST).

Actually, more specifically, I would like any code, documentation,
or reference that allows me to register a disk/hard/ram
drive (and a library to access said drive).

Thanks in advance.. and I know I'm probably out of luck... heh

I think the best solution is to look in FreeMiNT sources -- it
implements /ram (or so) device which is dynamically sized ramdisk
drive...

> Thanks in advance.. and I know I'm probably out of luck... heh
No, you aren't :)

Source record: 6985

At the club meeting last night, I was trying to get Mark set up with MagxNet and the dialler. We came to a stop though, as the directions for installing that called for some components to be copied into the u:/etc folder.

The question then is how to create this virtual folder, as it doesn't exist on his system (MagiC 6. something)?

Yeah. Basilisk II basically runs MacOS native alongside AmigaOS or
NetBSD. Mac apps are a lot cleaner compared to Atari/TOS apps. Allmost
everything is covered by the OS and they don't touch the hardware
directly. It's more a matter of patching the Mac ROMs than emulating
hardware.

> Well various vesions of doom have run to varying degrees. The sound has been
> the biggest problem. There seem to be keyboard problems in the last release.

I have the same problems on the Hades. Are there any public programming
docs for the Milan?

Hi All,

I've created little plugin for Total Commander. It's name is 'Juliet'.
It's an early version and it can only extract/view files from ST image.
I'm thinking about adding MSA and DIM support in next release.
Please try 'Juliet' and give me your feedback.

-2006-10-26-
I've attached new version of Juliet.

Bugs fixed:
Name's Length from 7+3 to 8+3
Volumie ID anymore shows as file
Max archive size = 2MB
Features:
The only valid image disk are accepted (bootsector verification)
MSA support added (Readonly mode)

http://www.atari-forum.com/viewtopic.php?t=9723

Hi Derryck!

DC>The question then is how to create this virtual folder, as it doesn't
DC>exist on his system (MagiC 6. something)?

The real folder must be on a VFAT partition (long file names
permanently enabled). The virtual folder on U: is a symlink and can
be created on bootup using the tool link2u, IIRC by Daniel
Augsburger.

I think none of these converters can be programmed at all, at least not in a way that it makes sense. Converting a procedural program to an object oriented language may technically be possible, but what do I gain when using not using C but using Java in a purely procedural way? Converting Java to C is impossible because C does not support object oriented features. When programming in Java one makes heavily use of these features. Converting Java to C++ would be easier, but if nevertheless hardly possible. The dynamics of the Java programming language are not offered by C++.

It does. I've put together a boot floppy image now with fVDI, MiNT and
fVDI. It's working fine so far with TOS 4.04.

I beg to differ on the fundamental argument about object orientation.
In the end C++ can be perfectly converted to C, assembler, or whatever very
low level language you choose.
The best proof is that the earlier C++ compilers were actually C compilers
using a C++ conversion layer (CFront)

http://en.wikipedia.org/wiki/Cfront

Now about Java, I cannot say, but it's not an "object orientation" problem,
it's more a "dynamic"/"run time evaluation" problem.

8275. GFA Basic in emulation?

Newsgroup: comp.sys.atari.st
Date: 2006-10-27 20:26:54 UTC
From: Tony Belding <zobeid@techie.com>
Message-ID: <20061027152654168O7-zobeid@techiecom>
Source record: 7002

I have an Atari ST emulator running on my Power Mac now, and I recently got my hands on the GFA BASIC manual and "The GFA BASIC Book" tutorial as published by Michtron. (That would be for GFA Basic 2, not 3.) The problem is. . . I still don't have the GFA Basic 2 interpreter, and I haven't been able to find anyplace where I can download it. I was under the impression that GFA made GFA Basic 2 freely distributable sometime after GFA Basic 3 hit the market, but I could be wrong about that.

I would even buy it on a floppy disk, if I could find one. . . Except that I don't have a floppy drive, and even I had one I wouldn't be sure how to transfer the program from the floppy into the emulator. (The instructions don't say anything about it being able to read a USB floppy drive.)

What should I do?

Yes, but I think the result was not meant to be edited by humans, but it
was just produced in order to be somehow compilable by existing
compilers. I had in mind that somebody might want to convert a Java
program to C in order to use and edit the resulting source code.

> Now about Java, I cannot say, but it's not an "object orientation" problem,
> it's more a "dynamic"/"run time evaluation" problem.

I agree, as long as you do not want to edit/maintain the resulting code.
Another problem is the Java extensive Java API, in particular the
GUI-related parts. One would have to map these to C GUI libraries, which
does not appear feasible for me. The rest of the API would also have to
be converted, which is theoretically possible since the Java source are
available. (Sun has announced to provide them under an open source
license early next year.)

Well, all this still does not mean that converting C to Java makes any
sense ;-). Creating Java byte code from C sources sounds like a more
promising approach to me.

From: vdjole@EUnet.yu
Message-ID: <ehv4ur$409$1@news.eunet.yu>
Source record: 7004

Version 3.85 of TeraDesk open-source desktop for the 16-bit and 32-bit lines of Atari computers is available at:

http://solair.eunet.yu/~vdjole/teradesk.htm

Beside the fixes for several bugs, this release contains some new features that were supposed to be part of more comprehensive changes intended be released as V3.90; however, because of the long time spent to find one of the bugs, and also due to some other circumstances, there was not enough progress made for a V3.90, and therefore this interim release.

See the history file for more information about latest changes and new features.

Have fun.

Hi,

<http://eureka.atari.org/MacAranym.zip> configuration has
been updated. ARAnyM being "ATARI Running on Any Machine"
<http://aranym.org/> is the virtual machine, also runs
under MacOSX.

Novelties :

- freeMiNT+XaAES the OS and its AES dated from 2006/09/23
- EmuTOS "free ROMs" dated from 2006/05/22
- Teradesk 3.85 the free GEM desktop
- Boxkite 2.32 the file selector
- EB_Dump 0.9.7 the screenshot accessory

ARAnyM GNU/GPL is released v0.9.4 beta. The Mac package is
built from my own, ready to start with.

Best ATARIan regards,

Because I use Boxkite on my Hades 60, in combination with freeMiNT
1.15.12 under N.AES 2.0 + Thing 1.27. I'm very impressed with
Boxkite, because I use to have Selectric before that.

That's in fact a Universal Binary executable that was built
on Philipp Donzé's machines. I personally have a PPC, and
the Intel support hasn't been tested by me yet.

It should work, not awfully slow on Mac Pro. Don't be surprised
if the bootup sequence is rather slow. It has no comparison with
all modern computers running Unices.

It should give <http://eureka.atari.org/aranym.gif> or about.

"There are a total of six jumpers on the video application slot, just in
front of the monitor connectors. See the illustration for the correct
position of these jumpers."

8291. Atari MEGA STE case repair

Newsgroup: comp.sys.atari.st
Date: 2006-10-29 21:27:15 UTC
From: Ryan <no@spam.invalid>
Message-ID: <no-BA8D09.15270929102006@news-fe-01.texas.rr.com>
Source record: 7018

Hi all. You may recall that a couple months ago I was asking whether any Atari MEGA STE came with a universal power supply, because I wanted to buy one in Germany and ship it to the U.S., since they're rather hard to find in the U.S., and expensive too. I just wanted to report that MEGA STEs in Germany do seem to have universal auto-switching power supplies. The power specs on the case bottom say it'll work on 110 or 220V power 50 or 60 Hz, and now that my German MEGA STE has arrived in Texas I can confirm that it powers up and works just fine!

The postal service was unkind to the package however (or you can blame me for not padding it properly on all sides before shipping it). As a result, one of the corners of the Atari case got a bit crushed. I spent some time trying to superglue it back together, but the plastic not only cracked but also got bent out of shape so it doesn't fit together properly anymore. It's only a small problem: the cracked area is just the triangle about a half-centimeter wide and 1.5 centimeters deep on the left front corner. But it's annoying, because part of the appeal of the MEGA STE for me is its cool case design.

You know how if you have a small hole in a wall you can fill it with Spackle to fix it? I'm wondering if there's something like that which would work on plastics. I would just need to sand down the parts that now stick out a little bit, and fill in the cracks with some kind of liquid plastic / glue goo. I don't know what I'm talking about. Anybody have any ideas? I don't even care if the color doesn't match the case, because I'm interested in painting the case eventually.... which is a whole 'nother thread in itself, I'm sure.

8292. Atari MEGA STE floppy power cable orientation

Newsgroup: comp.sys.atari.st
Date: 2006-10-29 21:29:19 UTC
From: Ryan <no@spam.invalid>
Message-ID: <no-5A9D0C.15291729102006@news-fe-01.texas.rr.com>
Source record: 7019

I took apart my "new" MEGA STE case to see what it was like, and disconnected the power cable from the floppy drive in the process. When trying to reassemble, I discovered that the cable would physically fit in either orientation, and now I'm afraid to reconnect it for fear I'll do it the wrong way and blow it up. Can somebody with a MEGA STE confirm the correct way that the cable is supposed to attach? Thanks so much.

Thank you for the offer!

It is not needed anymore, since I found the files on a magazine disk.

I used JB Weld to repair the broken plastic shaft of an Oscilloscope
knob. If you try JB Weld I would suggest the fast drying stuff, both
have a tendency to ooze before they set. Auto body filler may work, it
will stay where you put it until it sets.

no need to fear. you can't damage it by connecting to opposite side, it
wont work and that's all. tested for about 10 times ;-)

There is a product called "Repair Express" from Pattex. It is like
plasticine, but when it dries out it became hard. You can paint, drill,
furbish etc..

hrmm.. You said power cable and not data cable. Don't plug it in the
wrong way or you'll fry the drive. Done it once :-P The power connector
should have an indentation on one of the sides and a linear bump on the
other side offset near the middle. The bump side goes up, the indentation
side goes down.

Thanks,
mark

The Mouse on my St has an Amiga/Atari switch on the bottom. I think it
swaps two of the wires in the 9pin connector but it may be more complicated
than that.

That's the Application Systems Heidelberg homepage. No demo there. The only demo available there is MagiC PC (and, incidentally, that doesn't run under ARAnyM but gives four bombs)

I just received an email from a polish guy to inform me of that !
I'm very surprised and here is the answer I sent to him.
If somebody can help to know more about this strang story, I will very appreciate...
I keep hope to to get one day this motherboard and put it on my office's wall ;-)

I do not understand polish but the photo is the photo of the only one prototype of the Phenix, sure !

I'm very surprised to see this !

But I have not the Phenix mb since 2000 !
It was let in the CENTEK company I left !
My associates get the mb !
I do not know what they did with after !
I never heart news from the mb from them after, as I never get news from them too. I just know they stop activities on atari and continu programming some project on PC....
The company was in a bad financial status and it is sure it was closed in 2001 or 2002....
After no news at all from CENTEK and the Phenix mb !

YOU can speak POLISH with that guy, so ask him from where he get the mb !

I'm ready to buy it to get it here on my wall, because it is ME that designed and assembled it....
I always think one day I may get it, but let me know if this announce is serious or not....

Thanks a lot !

Under Gemulator 2000, the Atari part of the MagiC PC demo apparently
runs. So I thought it maybe runs under ARAnyM, too. Apparently this is
not the case.

Nope, you are correct, it's a simple case of swapping two wires.
Probably easier to do where the cable meets the mouses circuit board.

As far as I can tell its only old versions that work. I can't get either of
my 5, 6 or 6.2 versions to work under gemulator...

An ATARI machine that wouldn't let gamers playing, wouldn't
be a real ATARI platform ;)

> A novel processor design running open software.

The PlayStation3 OS will look like the PSP's one.

Everybody will be able to use a PS3 machine or a PPC Mac as
a devel platform thanks to YDL 5.0 Linux distro available at
mid-November 2006. Yellow Dog Linux distribution is "sponsored"
as a free PlayStation3 devel system by Freescale, IBM and Apple.

YDL 5.0 is installing on a PS3 or a PPC Mac, as an alternative
to the operating systems of Sony and Apple.

I personally have a dual-G4 that I also use to maintain the
MacOSX version of ARAnyM. I'm almost decided to buy a PS3 :)

I just wanted peoples to read about it.

Stay tuned :)

Regards,

Greetings everyone!

Here is the lucky and the proud winner of this months prize at The
DarkForce! BBS:

October 2006
1. ST Magazine - Dew-It wins the free 3 mag. subscription

Congratulations to our winner!

Also, here is next months prize:

November 2006
1. ST Magazine - some lucky Atari caller will win a free 3 magazine
subscription.

Good luck to all! :D

Hi all,

I thought I had read somewhere that the internal drive should not have
termination resistors.

Is this true? The Quantum 105S has the term packs on the drive...

Just wondering...

TIA,
Rory

8320. Re: Milan coding docs

Hi Ingo,

I'm mostly interesting in XBIOS functions related to video. I don't
have a Milan myself though, so I'll need good docs. Couldn't find what
I was looking at your (nice) page, but perhaps I missed it somehow?

regards

-- Peter

Its a long shot I know :) - but I'm rebuilding a Falcon MkX. Various bits are missing including the top part of the case. Anybody with any spare case parts or a complete case, anything really let me know.

Thanks!

Ian.

> XBIOS functions related to video.

Sorry some parts are in german, maybe someone can translate it.

```
-------------------------------cut-------------------------------
5.18 Setscreen, Milan
=====================

Name: ï¿½set screenï¿½ - initialisiert den Bildschirm.

Opcode: 5

Syntax: void Setscreen( void *par1, void *par2, int16_t rez,
int16_t command );

Description: Diese XBIOS-Routine entspricht der Funktion Setscreen
allerdings mit einem zusï¿½tzlichen Parameter und dient
dazu, Auflï¿½sung und Bildschirmspeicheradressen zu
verï¿½ndern.

Parameter | Meaning
----------+-------------------------
par1 | Je nach Funktion, s.u.
par2 | Je nach Funktion, s.u.
rez | always 0x4D49 (MI_MAGIC)
command | Kommando

Folgende Werte sind fï¿½r command definiert:

CMD_GETMODE (0) Getting current mode

LONG modus;

Setscreen(-1,
&modus,MI_MAGIC,CMD_GETMODE);

CMD_SETMODE (1) Set new graphic mode

LONG modus=0x1023 /* 800*608*16 */
Setscreen(-1,modus,MI_MAGIC,CMD_SETMODE)

BIOS and VDI will be initialised. Not
the AES.

CMD_GETINFO (2) Get screen info structure for mode

SCREENINFO si;
si.size = sizeof(SCREENINFO);
/* Structure size has to be
```

```
set */
si.devID =0x1022;
/* ID of the mode or 0 for
current mode */
si.scrFlags=0;
/* status of the operation */
Setscreen(-1,&si,MI_MAGIC,CMD_GETINFO)
if(si.scrFlags & SCRINFO_OK)
puts("OK");
else
puts("Error");
```

CMD_ALLOCPAGE (3) 2. Allocate screenpage

```
LONG adr=0;
/* Frame address or -1 */
Setscreen(-1,
modus,MI_MAGIC,CMD_ALLOCPAGE);
if(adr)
puts("OK");
else
puts("Error");
```

This only allocates one page. A further
call will only return the frame address.

CMD_FREEPAGE (4) 2. Release screenpage

```
Setscreen(-1,-1,MI_MAGIC,CMD_FREEPAGE)
```

The graphics card memory will be
released again. If the second page had
still been active the call will switch
back to the first page with Logbase and
Physbase set.

CMD_FLIPPAGE (5) Auf 2. Switch screenpage

```
Setscreen(-1,-1,MI_MAGIC,CMD_FLIPPAGE)
```

Will switch to the second screenpage.
Logbase and Physbase will be set.

CMD_ALLOCMEM (6) Allocate memory on the graphics card

```
SCRMEMBLK blk;

blk.size=sizeof(SCRMEMBLK);
blk.blk_y=200;
/* alloc a block of 200 lines*/

Setscreen(-1,&blk,MI_MAGIC,CMD_ALLOCMEM);
if(blk.blk_start)
puts("OK");
```

```
else
puts("Out of memory");
```

The width of the block is currently
always the width of the virtual screen.
For the hardware functions this block
will be like a screen (0,0,blk_w,blk_h),
the coordinates start in the top left
corner (0,0). It will be internally
recalculated.

CMD_FREEMEM (7) Release graphics card memory

```
Setscreen(-1, &blk,MI_MAGIC,CMD_FREEMEM);
```

blk of the block to be released.

CMD_SETADR (8) Set screen to fixed address

```
LONG logbase=blk.blk_start;
/* logical address or -1 */
LONG physbase=blk.blk_start;
/* physical address or -1 */

Setscreen(logbase,
physbase,MI_MAGIC,CMD_SETADR);
```

CMD_ENUMMODES (9) Requests all available modes, since
13.01.2000

```
LONG cdecl enumfunc(SCREENINFO *inf,
LONG flag)
{
printf("%s\n",inf->name);
return ENUMMODE_CONT;
}

Setscreen(-1,
&enumfunc,MI_MAGIC,CMD_ENUMMODES)
```

The function "enumfunc" will be called
once for every available mode.
ENUMMODE_EXIT (0) will cancel
CMD_ENUMMODES. ENUMMODE_CONT (1) will
continue. The parameters are handed over
to the stack using the C standard.

Return Value: Return value undefined.

Group: Bildschirmfunktionen

Availability: Die Funktion ist ab dem MilanTOS 4.08 verfï¿½gbar.

```

LONG blk_len; /* length of memblk */
LONG blk_x; /* x pos in total screen */
LONG blk_y; /* y pos in total screen */
LONG blk_w; /* width */
LONG blk_h; /* height */
LONG blk_wrap; /* width in bytes, ab: 13.01.2000 */
} SCRMEMBLK;
```

See Also: Setscreen, Milan

LINEA functiones (for information only)

All LineA functions work on the Milan too and use the
hardware functiones if available, otherwise it will be done
via software.

Standard graphic modes

The following screen modes are defined for the low lever driver. The ID numbers
are fixed and won't be changed.
All additional defined modes in MVDI.CNF, which aren't available
from this list recieve ID numbers starting from 0x2000.
These numbers are dynamic and may change after a restart.
If a standard mode is modified in the MVDI.CNF file the
ID number won't change.

Where can I find icons (folders and files) with the Atari logo etc. for use within MacOSX?
I could need some nice icons for those Atari emulators (ARAnyM, Hatari etc.)

8329. Re: Mega STe Internal SCSI

Source record: 6905

On 1 Nov 2006 18:50:31 -0800, Rory.A.McMahon@gmail.com wrote:
>
>I thought I had read somewhere that the internal drive should not have
>termination resistors.
>
>Is this true? The Quantum 105S has the term packs on the drive...
>

IIRC, the internal drive on a Mega is connected via an internal host adapter. So there is only one drive on the SCSI bus. So, assuming the host adapter conforms to the SCSI spec, there should be terminators on the host adaptor and on the drive. The bus itself is not very long, so even if the host adapter is conformant, you may well be able to get away with only one set of terminators (on the adapter). But the spec says there ought to be terminators on both.

Unless it's broken, my advice is not to try to fix it :-)

Roger

8331. Drivers for SupraDrive 20MB ?

Newsgroup: comp.sys.atari.st
Date: 2006-11-03 10:02:19 UTC
From: cii-2d21@iximail.com
Message-ID: <1162548139.452858.73620@k70g2000cwa.googlegroups.com>
Source record: 6908

I recently dug out a couple of SupraDrive units (20MB) which appear to be working OK (disks spin up etc). These have a DMA connector, and what looks like a through SCSI connector on the back too. The disk is labelled on the front 'Atari Hard Disk' so this is definitely the Atari version of the disk.

I cant seem to get these running with regular HD Driver - does anyone have the original driver for this disk unit?

Thanks

Ian.

I agree, this is true according to SCSI specs, but since when did Atari conform to the specs? ;-)

We are supposed remove the term resistors off the drive, as the resistors place extra load the bus, and the cable is supposed to be too short to allow meaningful reflections anyway. (I think this info is in the DOIT archive).

8340. What is this accelerator?

Newsgroup: comp.sys.atari.st
Date: 2006-11-06 10:25:59 UTC
From: cii-2d21@iximail.com
Message-ID: <1162808759.142187.148490@i42g2000cwa.googlegroups.com>
Source record: 6917

I'm having some trouble identifying an 'accelerator' mod on a Falcon MB. This appears to be a clock booster for the bus etc and is a green module (sealed) with several wires. There is also two wires attached to an LED. There are no labels on the unit which is about 3" by 1" in size and its stuck to the MB. Any idea what this might be? It must work OK as the Falcon boots normally, but I'm guessing there is a driver required to turn the accelerator on?

Cheers

Ian.

The LED is actually not visible from outside the case, I guess the
previous owner didnt want to drill the case. It is connected though and
its red. Its actually quite a neat unit compared with some I've seen :)
and is glued to the MB just next to the 68030.

Cheers

Ian.

Sounds like a powerUP2 accelerator, basically a clock doubler, runs the
CPU at 32Mhz.

You put a program in your AUTO folder called powerup2ON.prg (or
similar) to swictch it on and rename the program (substitute OFF for
ON) to switch it off.

Very simple to use although my LED doesn;t work any more on mine the
accelerator is still ok.

found out a bit more ....
Looks like its a Power Up or Power Up 2 accelerator that boosts your cpu
from 16Mhz to 32Mhz.
i think it needs a cpx to turn it on, anyone help ?

Not sure about this adapter - we produced our own adapter for the Milan, but
I guess the ET adapter is basically the same and should work on the Milan.

>Don't know what version flash the motherboard has, so the plan is to
>assemble the kit, and boot with the 040 first to examine the system.

Good idea. A certain minimum version of Bootblock and TOS is required to
support the 060, so you should first upgrade Bootblock and TOS to a current
version before plugging in the 060. After that, the machine should boot up
fine (at least with empty auto folder).

Integer 68060 emulation code is contained in the current TOS, for Floating
point applications, you will need the fpu__2m.prg in the auto folder.

Current TOS and bootblock are available from
http://www.ccac.rwth-aachen.de/~michaels/index.php/milan

Version 3.86 of TeraDesk open-source desktop for the 16-bit and 32-bit
lines of Atari computers is available at:

http://solair.eunet.yu/~vdjole/teradesk.htm

This release fixes a bug in the implementation of the AV-protocol.
See the history file for more information.

Have fun.

8354. Eiffel/PIC

Newsgroup: comp.sys.atari.st
Date: 2006-11-07 22:57:03 UTC
From: Mark D <mducksub@nosapspamatari-source.com>
Message-ID: <DYidnRBK-eOikszYnZ2dnUVZ_sqdnZ2d@speakeasy.net>
Source record: 6931

Hello guys,

Now that my ordeal is finished I want to give the following advice:

1. If you have an eiffel, be very careful about what hex you program into it or else you'll brick it! In my case I programmed the eiffel_i.hex into my non-interrupt capable eiffel. For some reason, I was able to get by by jumpering the fire button of JP1 to ground and I did for a while but the eiffel was always unstable and crashed after a couple of hours.

I bought a JDM style serial PIC programmer off ebay. The prog84 implementation for the Falcon is setup for parallel and serial won't work.

I have a USB serial adapter which doesn't put out enough voltages.

Under vmware I tried icprog, ponyprog, picpgm, and numerous other tools and had either limited or no success.

Under linux I tried prog84, ponyprog, and numerous other programmers and had no success. I gave up and took a server I had laying around and installed windows on it. Of course the disk in the server wasn't working so I had to find some ancient 4gb ide drive. The server only had 128megs of memory and windows xp didn't want to install.

So finally after 2.5 days STRAIGHT of trying to get this PIC programmed, I finally got it using just one possible combination. A server with windows XP and a good STRONG serial port, using ONLY PICPGM.

So in summarization - 1: I can program PIC's for people now :-P, 2: stay away from these stupid serial PIC programmers, go for parallel. and 3: ARGH! But at least my eiffel works again!

Thanks,
Mark

Thanks mate. Having trouble keeping up with you atm;-).

Is it worth reloading with the new Easymint files? Starting fresh?

Cheers

Mark

If you use a commercial programmer such as a PicStart+ or an ICD2 then you
can reflash as many times as you want.

These JDM / DIY programmers are not a worthwhile investment when factoring
in the amount of time wasted in trying to track down perculiar problems.
Stay away from any of them, serial or parallel. You're not meant to be
generating the voltages from the ports, it's a quick hack for hobbyists.

An ICD2 is highly recommended :-) About £150.

8358. C programming

I would recommend Lattice C, but I can *not* tell you where
to find a compiler to buy. Lattice C contains most of the
standard C library functions in its library. An author named
Clayton Walnum had a regular column starting in ANALOG and
moving into ST-Log magazine, called "C-manship". If you can
get those, it may be of use to you.

Some of the "C-manship" articles are available at:

http://www.atarimagazines.com/st-log/index/index.php?author=Clayton+Walnum

Hello,

this is great news :) I can _highly_ recommned you to start with Pure C. It can be downloaded from here: http://rg.atari.org/source.htm. It's really simple, english gui, easy project syntax. It includes assembler, linker, compiler.

Later you can switch to gnu c on FreeMiNT but Pure C is really good start to. If you have any question, don't hesistate to ask :)

I can also recommend great book/html/hypertext called Atari Compendium where you can find a lot of stuff about Atari and C programming and system calls as well.

If you have any questions, just ask.

Why not just read the whole C-Manship Complete book online?

http://cmanship.atariforge.org/

The html needs to be edited, the conversion made a ton of mistakes. I
have the html on the AtariForge CVS and I'm slowly making some minor
changes. The CVS and project page are -
http://atariforge.org/gf/project/c-man

I'm looking for help editing the html.. post a message on the
C-Manship Forum on the AtariForge project page if you would like to
have admin access to the CVS and help edit the html.

Message-ID: <1163026209.91634.0@iris.uk.clara.net>
Source record: 6939

Guys,
More great auctions, with plenty of HTF titles including PC Ultima 1 in as-new condition and a bunch of great Amiga and ST titles, as well as plenty of C64 disks, including a couple of C128 specific.
Items are in the UK, and in Pounds Sterling (shipping will be higher to the US/abroad), but you will be hard pressed to find some of these in this condition again.
Seriously - have a look through, lots of hard-to-find titles (some sealed), I will also be putting up a number of Atari 8-Bit titles this coming Sunday (12th November).

http://search.ebay.com/_W0QQfgtpZ1QQfrppZ25QQsassZcawley1 (US list)

http://search.ebay.co.uk/_W0QQfgtpZ1QQfrppZ25QQfsooZ1QQfsopZ2QQsassZcawley1 (UK list)

Cheers,
Paul

8363. English Freedom2 HYP?

I believe he had some kind of hard drive crash, from the e-mails I've been
exchanging with him.

Try again later, and if its still not up, then I'd guess thats what it is.

8366. GEM Instant Messenger

Newsgroup: comp.sys.atari.st
Date: 2006-11-09 05:11:37 UTC
From: Mark D <mducksub@aosodokawatari-source.com>
Message-ID: <sMGdneRiKcsUJc_YnZ2dnUVZ_uydnZ2d@speakeasy.net>
Source record: 6943

Hey Guys,

I'd like to report that GEM Instant Messenger version 1.0 is well under way. Much of the code is being rewritten to be more pluggable. I'm happy to report that initial plugging in of the new libfaim code is working!

This means:
server side buddy lists
multiple logins and interaction with Aim System
more features, including file transfers chats etc

Server side buddy lists also work, and work implicitly right now...

This should also mean:
STiK support coming soon
MagiC support coming soon (I *hope*, not sure yet)
End of the infamous full cpu bug that affects not only the latest versions ataricq but gim as well.

The alpha that I've got running now is already pretty snazzy. Using the help of zview codecs i plan to snazz up the UI a whole lot.

After that I plan to finish up SUM and sparemint and give a full forward push to get it deployed on the live sparemint site.

In the mean time I've also started analyzing the mint kernel and am going to try my hand at implementing swap memory and BSD UVM. Mikro, if you're alive, I'd love to see what you've done on this so far.

Thanks,
Mark

I am quite curious, what is the "infamous cpu bug" that AtarICQ
supposedly suffers from?

Well it could have been fixed in newer versions, but it's definitely
something caused by libfaim at least on my system. CPU time starts
getting sucked down after you let it sit an hour or so. I'll have to
verify it exists on newer versions. Didn't mean to put down your software
or anything :-P If it exists, I know it's not your fault.

AND I just found out it's doing it with newer versions too.

Thanks,
Mark

Thanks for the useful link. Browsing the files I think I found a bug in
GODLIB\COOKIE\COOKIE.C:
The function CookieJar_SetCookie should set the value of a cookie if
exists and add a new cookie if it doesn't exist. But it doesn't check
if it reaches the end of the cookie jar. Am I correct?
Can you please provide me a link to guide me to develop GEM based
applications?

Thanks,
Jozsi

8381. The ATARI ST is the most homosexual computer EVER!!!

Newsgroup: comp.sys.atari.st
Date: 2006-11-10 04:29:22 UTC
From: Ed Zagmoon <spartan_isle@yahoo.com>
Message-ID: <1163132962.699411.65900@m7g2000cwm.googlegroups.com>
Source record: 6858
Cross-posted to: comp.sys.amiga.hardware,comp.sys.atari.st,alt.recipes.babies

All the ATARI ST owners I know are 100% GAY. I recently found out why:

The ST has, hidden deep inside on it's circuit board a hidden "gaydar chip".

This chip does not only make every ATARI ST gay within 30 days, but it does also attract a gay muscleman (*) within 24 hours who will shove his
"joystick" up the "user port" of the ATARI ST user's ass.

That means, if you switch on your ST and wait for 24 hours, you'll lose your anal virginity. If you let it run for 30 days, you'll become 100% gay.

To prevent this, you have to use a chemical called cyclotrimethylenetrinitramine.
Put the substance into your ST, the more, the better and blow the thing up.

Then, after solving the ST problem, go and buy an AMIGA, a computer for REAL men.

(*) If you're female, instead of a gay muscleman a 300 pound bulldyke with
a strap-on dildo will visit you within 24 hours.

This is not true. It's correct official documentation (help files) is
in german but some guy years ago translated & recompiled english help.
iirc it was spreaded under the name elf_help or something like that.

(update: yep, i'm right ;-) http://elfsoft.home.mindspring.com/prod.htm

Quite interesting approach.

I am not overly sensitive, so no harm done. I must say however that
using someone elses app as an example of a certain bug/problem without
even looking at it, isn't very professional.

Regards,

/Joakim

Source record: 6876

U14 is at least 3 NOR gates, marked as type 1488. It feeds the ST serial port, as near as I can tell. What did you feed that RS-232C port to do that? U-13, marked 1489, should be dead too.

I've got a bunch of software for the Atari ST available free. I've not sorted it all yet.

It definitely includes Calamus SL, which is the major desktop publishing program for the ST series. It's an old version, but gives you the option of upgrading to the latest at a very large discount.

Also EasyDraw, Superbase Personal, That's Write, and various other application and utility software. I don't have any music software, though. I'll sort it all, and give more details later. For the moment, ask and I'll see if I have what you want.

Some of the items come with heavy manuals, so if you want things mailed there will be a significant cost. I don't object to mailing it overseas but postage costs are likely to be too great to make it worthwhile, even for Calamus.

8405. Help with TeraDesk manual

Newsgroup: comp.sys.atari.st
Date: 2006-11-12 21:19:31 UTC
From: vdjole@EUnet.yu
Message-ID: <ej8351ntr1@news.eunet.yu>
Source record: 6882

Hello;

For some time now I have been maintaining TeraDesk open source desktop and also the hypertext manual for it. I try to maintain the manual to the best of my ability, but, as English is not my native language, I am aware that many details of that text could have been better phrased, other words used, etc. I have learned English long ago and do not use it very often today, so that I have lost the edge.

Help of a person competent in British English in redaction of the manual would be appreciated, so that the next release can be better. If anybody is willing to give a hand, please contact me by e-mail.

Thanks in advance;

Thanks, Mark. I figured connecting the power cable backward would be
bad. Just to make sure we're talking about the same bumps and are not
confusing "up" and "down" (since the drive is upside-down when sitting
in the upside-down top of the Atari case), I took some photos. Now...
which way should it be? :-P

8409. Atari MEGA STE power LED cable

Newsgroup: comp.sys.atari.st
Date: 2006-11-13 05:00:25 UTC
From: Ryan <no@spam.invalid>
Message-ID: <no-34D5A4.23002412112006@news-fe-03.texas.rr.com>
Source record: 6886

Hello everybody!

When taking apart my Atari MEGA STE I disconnected the power LED cable from the logic board, carefully noting where it had been plugged in and in which orientation the cable had attached. When reassembling, I plugged the cable back in again, but was unhappy to see that the LED did not turn on. Opening the case again, I realized why: at the *other* end of the cable, the one near the LED, one wire had come loose.

http://ryandesign.com/tmp/atari-mega-ste-power-led-cable.jpg

Can someone with a working MEGA STE power LED tell me where I need to solder that red wire to make it work again? Thanks.

OK, undo the screw on the bottom of that steel bracket. Inside the bezel (rubber thingy) and you will see a bog standard LED. You will have to remove the LED, strip back the wire, resolder and insulate the joint. Fixed.

Mark

Source record: 6895

Having downloaded and installed Mac-Aranym I find myself not really
being able to do much. The documentation supplied with it is quite
sparse and seems to be mostly geared towards developers with its
technical stuff.

1) I hate that Mac-Aranym needs to place its files inside my
"Documents" folder. Can I configure it to have its files elsewhere,
like in the Applications folder?

2) Once running I can't move the mouse-pointer outside the Atari ST
desktop window. How do I change this so I can temporarily exit the
Atari desktop window, or make the mouse-pointer move beyond the desktop
and enter the Mac domain again?

3) How do I create a virtual hard drive for Mac-Aranym to use?

4) Is it possible to use TOS 2.06 with it?

Is there any usable documentation for Mac-Aranym which is more for the
ordinary user?
Alternatively, are there Atari ST emulators on the Mac which are easier
to use?

I can confirm this. I'm using AtarICQ since the beginning.
Eventhough I've a Linux box besides me I prefer to use AICQ. Only in
some rare occassion I use the Linux ICQ clients.

Take care,

I have no experiences with godlib but i expect it isn't suited for
68010 ;-) Maybe some 030 code is used but this one you simply don't
need if you develop for 68000. Contacting author would be a good idea :)

Can someone explain how to go about how to port over ST files into a
format that's readable on a PC?

8427. FA: HTF C64, PC, Atari ST, Amiga titles

Newsgroup: comp.sys.atari.st
Date: 2006-11-14 21:27:32 UTC
From: Paul Cawley <paul.cawley@clara.co.uk>
Message-ID: <1163539644.95629.0@iris.uk.clara.net>
Source record: 6704

Guys,

*** Re-listed die to eBay stupidity! ***

More great auctions, with plenty of HTF titles in as-new condition,
including a bunch of great PC, Amiga and ST titles, as well as plenty of C64
disks, including a couple of C128 specific.
Items are in the UK, and in Pounds Sterling (shipping will be higher to the
US/abroad), but you will be hard pressed to find some of these in this
condition again.
Seriously - have a look through, lots of hard-to-find titles (some sealed),
I will also be putting up a number of Atari 8-Bit titles this coming Sunday
(12th November).

http://search.ebay.com/_W0QQfgtpZ1QQfrppZ25QQsassZcawley1 (US list)

http://search.ebay.co.uk/_W0QQfgtpZ1QQfrppZ25QQfsooZ1QQfsopZ2QQsassZcawley1
(UK list)

Cheers,
Paul

Your question is a little ambiguous. Think about it a while and search
google. I'm sure what you want has been discussed many many times.
Whatever it is.

8431. Game copying (restoring) question

Newsgroup: comp.sys.atari.st
Date: 2006-11-14 23:59:21 UTC
From: STcomp@cwo.com
Message-ID: <1163548761.577973.33230@b28g2000cwb.googlegroups.com>
Source record: 6708

Hi, I am an Atari ST game collector, and gamer, and I was lucky enough to get my hands on a mint condition Hard N Heavy original disk box and manual. Unfortunately, somebody copied some crappy midi files on to the original disk. :(However the disk is in good condition still, and I happen to also have an original Hard N Heavy disk from a re-line compilation. :) (which should have the identical code and format)

My question is: is the copy protection tough on Hard N Heavy, or might it be possible for me to restore the erased original Hard N Heavy disk with my other Hard N Heavy original disk?

Would I need special copy software? Perhaps a discovery cart (is that what they were called?)

Thanks in advance for any info! -SaTcom2

Give it a try and see if it works. Try using fast copy if that is no go
see if you can get a copy of A-copy and use that.

Mark

I just tried Fcopy and Acopy and neither one worked. If anyone out
there can help me figure out how to copy Hard N Heavy I would
appreciate it. In the mean time I'll keep fiddling around with stuff.
Thanks.

Just wondering what might be on these ROM's. They are official Atari
ROM's,
type AM 1 8517MAA

The numbers on the ROM's are

C026035-01 (with a '10' marked in tipex)

and

C026034-01 (with a '80' marked in tipex)

any ideas?

Thanks

Ian.

Use a PARCP cable. Certainly one of the most reliable and predictable
methods. Search for PARCP.

Its a bit more involved, but if you have, or can get a 2nd floppy drive
(SF314 preferably), then find or make a Blitz cable. Using the Blitz
software/cable combo, you can copy most protected floppy disks.

Its as simple as putting the original floppy in Drive A and the target
floppy in Drive B and running the software.

The Blitz combo bypasses the ST's floppy drive controller, circumventing
almost all forms of floppy disk based protection.

HTHs.

These are BOOT ROM for ATARI ST without TOS.... the first ST were furnished
like this and the TOS was loaded for a disk.
These ROMS contain a very nice screen with 512 colors cycling back and a
floppy drive SF314 image (bitmap !)...
I love this because it remembers me the first time I use an ST...in 1986...

34 & 35 are for a country...several different countries are existing with
different terminations like -32 & 33 by example.

I have the files if somebody want to use...

yep, disk tos was pretty useless - I think you had about 200K left...oh and
it bombed rather alot - or rather 'mushroom clouded'....

I seem to recall some demo used that screen if anyone wants to see what an
early st boot up looked like....

damn, what was the demo called.....

Well amiga does mean girlfriend in Spanish (or more precisely a friend
who is feminine), which is just as well as people like Ed here are
unlikely to find many 'Amigas' of the human variety... :-))

I think only certain cards (Symbios) work, using Michael Schwingen's
SCSI driver. Most likely Michael can comment on this.

Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Hi,

> Can someone explain how to go about how to port over ST files into a
> format that's readable on a PC?

What is exactly what you want?

Do you want ro read files from floppys which are formated on a Atari ST?
If yes, go to my homepage http://www.mbernstein.de to the download
section (floppy icon) and then to the Atari section. There is a program
st2dos which can modify your floppys without data loss in a way, that
a pc can read them. Note that any executabke boot sector is not more
executable after this modification. Higher formats can not be converted.

Do you want to convert file formats of atari programs to file formats
which can be read by software from pcs? I yes, please specify, which
format you want to read.

Do you want to build .ST images from your Atari ST floppys? Then you
can find software with google which can save images as .ST and .MSA

I hope, my hints are helpfull.

Regards
Michael

Is it possible for an LED to corrode metal? Why would that happen? Look
at that photo above again and you see the metal bracket is discolored. I
looked at the other LEDs too; the HD activity LED is very interesting.
It seems to have rusted away quite a bit of its bracket.

http://ryandesign.com/tmp/atari-mega-ste-hd-led-corrosion.jpg

The floppy activity LED I could not immediately see because it's inside
the floppy drive itself.

http://ryandesign.com/tmp/atari-mega-ste-floppy-led.jpg

Have anybody else's LEDs done this to their Ataris' brackets?

If these LEDs are responsible for this corrosion, would new LEDs be
better? I could replace them. Looks like the HD and power LEDs are about
3mm across. Guess that's a standard size. Could make 'em all the same
color. Maybe blue. Not sure if I can get at the LED in the floppy drive
though, nor whether I'll be able to get the new power and HD LEDs into
the existing brackets. Anyone done this before?

Depends what you mean by speed :-). If you're just interested in raw
data transfer rate, there's one available here:
http://www.anodynesoftware.com/freeware/main.htm

If you want some combination of seek time, latency, and transfer rate,
then one of the standard benchmark programs (e.g. zbench) should do.

Roger

8462. Free software (well, you gotta pay postage)

Tha ATI is probably better, although I don't have much experience with ATI
cards except getting them up im 640x480 monochrome mode (VGA bios emulator
and TOS).

>Are there specific SCSI cards to be used, or will most ADAPTEC cards
>work with the SCSI BIOS? Is there a particular order the cards should

My driver only supports Symbios/LSI Logic 53C810 chips - these are available
on multiple cards, from the Asus SC200 to noname. I do not know any driver
that supports adaptec cards.

The bare minimum is a power supply and a speaker - you should at least get
some beep code from the board.

To get video output, you need the VGA card and memory - there has to be at
least 16MB in bank 0. Old bootblock versions will start up the video card
without any memory, but newer ones will just beep (because the 8086 emulator
used for the VGA bios on newer video cards simply needs memory).

Guys,

*** Re-listed due to eBay stupidity! ***

Less than 24 hours to go, with plenty of HTF titles in as-new condition, including a bunch of great PC, Amiga and ST titles, as well as plenty of C64 disks, including a couple of C128 specific, many still at their listing price!
Items are in the UK, and in Pounds Sterling (shipping will be higher to the US/abroad), but you will be hard pressed to find some of these in this condition again.
Seriously - have a look through, lots of hard-to-find titles (some sealed), I will also likely be putting up a large number of Atari 8-Bit titles this coming Sunday (12th November).

http://search.ebay.com/_W0QQfgtpZ1QQfrppZ25QQsassZcawley1 (US list)

http://search.ebay.co.uk/_W0QQfgtpZ1QQfrppZ25QQfsooZ1QQfsopZ2QQsassZcawley1 (UK list)

Cheers,
Paul

Hi Roger :-)

Thanks.

I'm at the final stages of testing of my new memory card hard disk. It's
fast!! At the moment I'm shifting a single sector about in 500uS including
command negociation. It's looking to be about the ST's limit of 1Mbyte/s
with almost no latency. :-)

This has been in development for about 18-months information gathering.

Here it is on the analyser;
http://www.logicsays.com/pub/LAS/PrintCapture0020.gif

Aly and Roger

There was a very useful utility HOW_FAST by Christian Moeller,
published by /ST Computer/ magazine on one of their PD disks,
which plots a graph of transfer speeds versus block/file sizes for
both read and write operations via the OS (or read-only if you
prefer); you can set limits for smallest and largest block size,
block growth and number of tests as well as Y-axis markings. You
can also save the data as a text file for future reference.

I have translated all the files into English and can send them to
you if you like - the originals only amount to some 47 kB (before
compression or miming).

Regards, /Peter/

Oh for a logic analyser, drool ... would have been *very* useful when I
was reverse engineering the SCSI/Link hardware ...

It looks like you ought to be able to shift 255 sectors at a time, at
about 1.5MB/sec ... or have I missed something?

Updated atari stuffs list + Pc list (Memory, PCI boards, PSU, CD-ROM, HDD, ...).

ATARI

- Falcon 4/14 MB ST-RAM SIMM card with 4 MB 10 ?

- Falcon SCSI-2 Cable (from Falcon to SCSI-50pins) 5 ?

- 4.3 GB HDD 3.5 IDE QUANTUM Fireball CR 15 ? Ready with BOOT for Atari

- IDE 40 wires ribbon cable for 2 HDD 1 ?

- SDRAM 64Mbytes PC100 for CT60/63 2 ? OK on CT60/63

- RAM two 1MB SIMMs for 2MB upgrade STE/MSTE 2 ?

- ST/STF/MST HD Kit for 1.44 Floppy Drive 5 ? (english manual + software)

- Atari floppy external 14 pins cable 1 ?

- TT CPU Daughter board (for TT mb first generation) 15 ?

- TT-RAM board with 4 MB (upgradable to 16 MB) 15 ?

- TT rear metal VME bus cover with SERIAL ports 1 ?

- TT SCSI cable (from TT SCSI to SCSI-50pins) 5 ?

- SCSI case (new state) 5 ?

- Jaguar Power Supply (230V / 50 Hz / French AC con.) 5 ?

- ST/STE/F30 keyboard to ext. RJ11 keyb. Cable adaptor 5 ?

- External floppy drive 5.1/4 for Atari (!) + a second one 2 ?

- Internal Floppy Side Selector (connected on 14pins con.) 1 ? To boot on Side B of a 3.5 disk

- Atari calculator (new in the plastic box) 5 ? COLLECTOR

- Atari MEGA ST Slot Diagnostic card 5 ? (complement of the Cartridge)

- Atari Keyboard plastic contacts under keys (bag) 1 ?

- Atari 1 x 7800 joypads
5 ?

- Quickjoy game joystick with Autofire and ST/CPC sel. 1 ?

- Cartridge with MAC ROMS for SPECTRE 5 ?

- CD-ROM : TOS2WIN (1996) 1 ?

- CD-ROM : Service DEMOS (ST/STE/Falcon) -12/1997 1 ?

- CD-ROM : Atari Mega Archive Volume 2 (may 1995) 1 ?

- 35 disks with software (utility and others)
1 ?

- Official shop sticker (88*20 cm) 'Atari Service' & under 10
? COLLECTOR

'Factory Authorized Network' (all on silver with blue letters & a red
Atari logo on left)

PC & co

- MC68882RC25A (FPU PGA case for Amiga boards 10 ?

- AGP S3 Trio 3D -1998
1 ?

- AGP ATI RAGE XL with 8 MB - 2000 1 ?

- PCI S3 Trio Virge/DX card with 4 MB - 1997 1 ?

Or the total load is too high - there is a limit to the capacitive load on the DRAM BUS, but is difficult to quantify. Stuffing in 4 SIMMs with 16 chips each might be aboce the limit, which may lead to memory errors. The safest method is to use 2-3 SIMMs of higher capacity, when using all 4 slots, you get less problems with SIMMs that have fewer chips on them, but that may require some experimentation.

>CPU warms up.

It *should* simply work - however, we never tested the ET adapter. The 68060 adapter needs to do two things: it provides 3.3V for the 68060, *and* it does some minor bus timing adaption - I do not remember the details, but it was straight from the 68060 manual. Maybe Uwe can remember them?

>in Peter's article that the adapter he purchased from Uwe came with a

It might be a problem with the adapter - not a defective adapter, but maybe
the adapter does not everything that the original Milan adapter did.

>I reinstalled the 68040 and the Milan boots to desktop.
>Do you have current contact information for Uwe, or access to the

Technically yes, it should be able to block shift 255 sectors. I've noticed certainly with Atari's ACSI drivers that it will only read one sector at a time.

The analyser has been a godsend, spent months mulling over the market.

This for example is everything involved in booting up a drive, these are 6-byte commands;

Atari's.

I can only go from what I see in front of me on an analyser. It's reading
contigious sectors each with a fresh command.

AHDI reads/writes up to 255 contiguous sectors per command when
accessing the ACSI bus.
The code bootstrapping the driver (i.e. SHDRIVER.SYS or any other drive)
reads only one sector per command, if I remember correctly, but this
code is only used during system initialization. I guess that you were
referring to the boot code when talking about reading only one sector at
a time?

Just a note: AHDI also does not read/write more than 255 contiguous
sectors when accessing the SCSI bus (TT/Falcon), even though a higher
sectour count is possible here out of the box. Other drivers do not
suffer this limitation.

Do you perhaps have an accessory called "Trashy" installed? I remember that trash can -- every couple of hours the trash can would giggle and hide under another icon, but since I usually had a window covering the screen I would just hear a strange giggle that really didn't sound like it was coming from the computer. When I returned to the desktop I often didn't look for the trash can, and when I did I couldn't figure out why the desktop file wasn't saving the trash's location where I placed it. It took months to figure out that practical joke.

I don't think I kept that accessory because it wasn't stable, but I still have several practical joke .acc files. My favorite is "Gravity", which makes the mouse fall to the bottom of the screen. Unfortunately, it only works well in single-TOS mode.

Just as a note to the ST users out there -- Geneva/NeoDesk is an
excellent operating system for 2 & 4 MB STs. I use it extensively on
an STe and Falcon, and I believe that it can even be used with a dual
floppy (no hard drive) configuration.

> So where are you from Peter?

Just in case Peter doesn't see the question - he lives in west London
and is a member of both DDP Translations and the CCC.

Just in case anyone's interested, the next meeting of the latter is
this very evening - visit the URL below for a map and all the other
gory detail ;-)

Thanks for the opportunity for a very blatent plug ;-)

I do not have the CZ101 but I have the CT 640. I may have the MIDI
cables that I used to interface with my Atari 1040. If interested
e-mail me.

I am in central Florida

You mean $20-$30 for the lot right? Surely, otherwise $20-30 each would
be a bit silly... or maybe its a misprint and you meant $2-3?

I've had a few machines that did this. I'm guessing the rubber holder
and the metal holder dont like each other. :)

> The floppy activity LED I could not immediately see because it's inside

>
> http://ryandesign.com/tmp/atari-mega-ste-floppy-led.jpg

The plastic trapezoid piece comes out. 3mm led will work fine. I have
made one of my TT all blue leds and one TT with a red(power)
white(floppy) and blue(hard drive) leds.

Yes, all LEDs and all brackets. Most of the little rubber grommets have
seen much better days. I like the idea of different colors. Thanks for the
inspiration.

And when you have found one, you can use one of the CZ101 editors that
have been written for the ATARI ST, and come back to tell/ask us about it
:-)

I'm sure Sniperstorm will answer, but I know a few things about
his setup:

4 meg 520 Atari STe
1 4 Gig Hard Drive
1 212 Meg Hard Drive
1 240 Meg Hard Drive
1 100 Meg Zip Drive

and he's running the same BBS software I am, BBS Express! ST. Also, like
me, he's using the Lantronix UDS10 serial to LAN converter to make his BBS
available by telnet.

HTHs! :)

Hi guys,

Just a quick question that jumped into my head after reading what the specs were for the BBS Atari in the St Guild BBS thread just below.

Noticed they were all single disks - does that mean you can't use RAID (no third party cards?) in ST/E's, Mega's or TT's?

I think Atari pre-dates raid by several years. If you had a reasonably
up-to-daye SCSI driver such as HD Driver you could use an external SCSI raid
controller. For example:-

http://www.pcmall.com/pcmall/shop/detail~dpno~7056664.asp

However as these often present the raid volums as multiple LUNS on a single
SCSI ID you would only get two...

Hmm, would that be like a SCSI CD-changer? If so, it might work, because I used *2* Pioneer 6 pack CD-changers at one time on my BBS in the late 90's. ExtenDOS did great with that.

Perhaps HDDriver would support RAID in the same way?

As far as HDDRIVER is concerned two LUNs per ID is just a software
restriction since more than two LUNs per devices are unusual, at least
for devices connected to the Atari.
In principal more than two LUNs are possible.

It depends on how LUNs are used. As mentioned in my previous posting
even though HDDRIVER currently only supports two LUNs more than two can
be supported with a software change.
But if automatically switching LUNs is required special software would
be needed, that knows how to handle the RAID device. I guess this is
what ExtenDOS does: Using the SCSI driver interface in order to control
the LUN selection as needed.

Hello :)
I am happy owner of atari 1040 ste :)
It has no hard drive, and I am thinkind to build interface for it like
described at
http://members.tripod.com/~piters/atari/astide.htm
Besides, other links to ide interfaces doesn't work.

That's why I have some questions.
I've read that it should work with tos 2.0.6 but
on my atari it is 1.0.6
There are some program on the site named seltos.prg , so can I use it
to work with hard drive?
I don't really understand how it works. If anyone has experience with
it please, tell me is it
use other ram locations or may be it can map tos image to location
where it should be etc?

And finally.
I can't find debian/atari iso images in the net, seems they all are
deleted.
I found only one site
http://www.1632-sales.zenwebhosting.com/acatalog/16_32_Catalogue_Whiteline_CD_Series_2.htm
l
and there are some linux 68k cd's available. Anyway I prefer to find
debian slink for atari 68k but can't find it.
If I manage to find it or if I by one of the proposed cd's will linux
or other unix like MiNT work with my ide drives?
Thanks

Well, if you've got a 1040ste, you've probably got 1Mb of memory and a
68000 CPU, right? I don't remember if you have an FPU in those or not.
Anyway, Debian Linux requires quite a lot of memory (for our Atari's,
anyway). I think the requirement according to the documentation is 32Mb
(if I remember correctly). Also, a 68000 will be dead slow, and you
must have an FPU, I think. So on your machine, I'm afraid Debian won't
run too well.

If you have access to a higher powered Atari (like a Hades, Milan, or
CT60/63 Falcon), you can get the latest Debian Linux builds for the
Atari directly from their site, or from one of the distributors listed
on their site. The URL is www.debian.org, and you just need the 68k
version, which will come with installers for Ataris, Amigas, 68k Macs,
etc. I'm not sure how useful it is for us, though. This may or may not
be correct, but I've read somewhere that they don't have GUI video
drivers for Atari machines yet, so you're stuck with text and no GUI,
which means all the fun software is off-limits. I don't know if this
has changed with the most recent versions, though. I hope it has! I'd
love to run Firefox on my CT60 Falcon!!!

If you're just looking for any basic Unix, Mint would be the better
choice. It's faster (optimized specifically for our machines) and can
run both Unix (text-only and a few X11 programs) and Atari software at
the same time. For your machine, I'd recommend getting the latest Mint
kernal, XaAES, and your favorite desktop (Teradesk is a free one that's
great for lower-spec'd machines).

Good luck!

That's correct, and relatively simple IIRC. From ExtenDOS's POV, each
LUN is a separate device.

It seems to me that supporting RAID on the Atari could (would have to)
be done entirely in software, in which case there would be no
restrictions on the addresses of the devices concerned. But it would
not be a trivial undertaking.

8520. Socketed chips, is there a way to improve conductivity on the chip legs?

Newsgroup: comp.sys.atari.st
Date: 2006-11-29 04:21:17 UTC
From: STcomp@cwo.com
Message-ID: <1164774077.251876.8400@h54g2000cwb.googlegroups.com>
Source record: 6847

I have an Atari STe that has been driving me nuts for years, because any time it is cold in the morning, or I bump the case, the TOS chips creep a little bit and the computer bombs out. I took the chips out one time and went over the chip legs with an eraser, then put them back in the socket, and that helped for a matter of months before they started acting up again.

Has anyone out there has found any kind of paste, liquid, or other coating that could be used on socketed chip legs to improve conductivity so that they would not be so sensitive to movement, and/or becoming oxidized?

Or maybe just something to keep newly cleaned metal to stay un-oxidized, so that the chips don't have to be pulled out and cleaned every 2 months.

I'm not interesting in hard-soldering the chip into the motherboard.

Has anyone tried that stuff they use to clean coins and silverware?

I also have the chip creep problem with my Adspeed 16 mhz board, which plugs in to the 68000 chip socket. The concept of keeping this Atari STe screwed together, instead of staring at a motherboard and (possibly being electrocuted by) an open power supply, seems novel at this point.

A word of warning to Falcon owners. Atari used a Dallas clock chip with an integrated battery in the Falcon. The chip is a 24-pin dual inline package device and is difficult to remove due to the tin leads and large ground plane. The battery is molded in the package and battery leads are not accessable. These chips have about a 10-12 year maximum life span.

Just trying to get the word out about this to the community.

Regards,
Glenn

This is old news, and not a severe fault. The chip will only loose time
and date or NVRAM contents. Cyclone / X-Troll was working on a small
utility that will restore NVRAM contents on boot time with an AUTO
folder utility.
Nothing to worry about if you ask me :)

And those who feel adventurous can replace the battery (or the whole chip)

cheers,
Matthias

Hi Matthias

Where can this NVRAM utility be found?

regards
Maurice

I'll meet and ask Cyclone during Paracon 8 Party this weekend.
AFAIK it is not openly available yet but I'm sure there will be some
interest!

cheers,
Matthias

Probably way off topic, but there are a few simple things that work. If oxidation is a problem, one may want to prevent the areas next to contact areas from corroding, and pushing the contact apart. One thing I find useful for a variety of uses, including oxidation-proofing chip pins is good old automatic tranny fluid, unless you have a sperm oil whale handy. It is designed not to bother plastics, to coat firmly, to fill voids, and other such things, and you need so very little.

Jim

I'd give the legs a thorough clean and then try either Vaseline or a careful dab of silver-loaded paint in each socket hole.

The Vaseline would keep air and moisture out, and the conductive paint would improve the connection.

Though I can't guarantee either, never having tried them.

If you wait a couple of months you won't have to. Exxos and I are getting seriously close to releasing our ACSI hard disk that plugs straight in the back of an ST. No soldering, as far as the ST is concerned it's just a totally standard Atari ACSI hard drive. It uses SD cards and will be about 2" square. Transfer rate is in the region of 500-1000Kbytes/second.

So, that's why we had no news from you during all this time...
Well if I had known that, I wouldn't have ordered a cartridge port solution
from Poland (paskud.pl)... that i'm still waiting for :(
Hopefully matters will be resolved (the guy claims to be very busy job-wise)
before christmas ...
Anyway that's excellent news and i'm eager to see what your hard disk is
looking like.

What I normally do is go over the legs with a fibre pen, clean them up, and
gunk the socket with conductive grease, no air around the pins, no problems.
You may also want to consider replacing the sockets with turnpin types.

Chris

This is a common issue in the arcade collecting world.

Usually (99.99999% here) it's bad sockets - not the actual chips

Either replace the sockets or reflow the solder on them, you have a hairline crack.

When the machine is cold the crack is bigger and makes your STE not work, as soon as it warms up (just from power on) the solder swells and it works.

That's all your problem is.

Oliver

I'm buying out an Atari warehouse that's been locked up for over a decade!
Below is a list of Games & more for ST & some for 8 Bit!Reserve your order
up front & I'll send them when I receive the lot! If this lot goes well,
I'll buy more Atari lots! Titles listed below I'll get 1, 2 or a few of.
Save Games from oblivion by PrePaying your order. All of these are NEW in
BOX! E-Mail BenSells@Atari.org or call (503)256-9974! 1st come, 1st serve!

Midway Battles and Ultima II are already spoken for.

Prices below are for one copy each.

8 bit titles

2 decision in the desert micropose $20
1 kennedy approach micropose $20
1 logo by atari, complete in thick silver box $20
1 napolean in russia datasoft $20

st titles

2 arcanan no excuses $20
1 auto duel origin $50
1 axe of rage epyx $20
1 data manager time works $20
3 design idea time works $20
1 down hill challenge broderbund $20
2 fleet sreet publishing michtron $20
3 fools errand miles $20
3 frostbyte microvalue $20
2 goldenpath firebird $20
3 gridiron glory by bethesda $20
3 lords of conflict by electronic arts $20
1 manhunter 2 sierra $30
1 midway battles tdc $20
1 olympus by olympus $20
1 operation clean streets broderbund $20
1 people places things time works $20
1 phantasm exocet $20
1 santa paravia by starsoft $20
1 sorcerer of claymorgue castle keypunch $20
1 space quest sierra $30
1 starflight tpi $20
1 stock market game tdc $20
2 summer games epyx $20

1 symbols and slogans time works $20
1 tank attack by artworx $20
1 targhan silamarlis $20
1 ultima II sierra $60
1 zynaps by hewson $20

I've got a fast turnaround rate. Usually, Once I receive payment your order goes out the same day. Customers love the speedy service! I have lots of Atari SoftWare & Books. Which I can send by Media Mail Rate!

I wouldn't do either of these. Electrical switch and contact cleaner is
the stuff to use.

True enough. However, this isn't that hard to fix WITHOUT removing the
chip.

The Dallas clock chip is shaped like a rectangle, much like a 2 x 4
square LEGO brick:

0000
0000

If you take a cutting wheel (Dremel) tool and grind down the top half
of the center portion away from the keyboard you will eventually
uncover the battery and the battery tabs:

. | Grind here
. v
0 0
0000

Note that some chips have a soft rubbery filling that is easily
removed. Mine had hard plastic throughout, so the cutting made a lot
of plastic dust, but that was easily blown from the motherboard. I
know that this sounds scary, but as long as you go slowly you should be
O.K.. There is a crystal on the left (by the dot on top of the chip)
that you don't want to damage, so keep your cutting to the center of
the chip away from the keyboard.

Both the battery and its tabs are silver, which stand out strongly
against the black plastic. The layout kind of resembles Mickey Mouse
with the circular battery "head" and the "ear" tabs at roughly 10:00
and 2:00 positions. The left tab is positive, and you need to cut it
away from the battery without destroying it in order to disconnect the
old battery. Again, a Dremel cutting wheel works nicely.

Now solder about 10 cm of wire to each of the two tabs. These are
reasonably large tabs and even a novice should be able to heat a wire,
melt some solder onto the wire, and touch the hot wire onto the tab so

that it sticks. (I know this isn't good soldering practice, but my point is that you can do this if you can figure out which end of the solder iron is the hot one!). Attach the other end of the wires to a battery holder, preferably to a coin cell holder. These are a bit hard to find, but a electronics shop should have one.

Place your 3V (preferably lithium) battery (size really doesn't matter, but the CR2032 is easy to find) into the battery holder and check that everything now works. Don't forget to insert the battery in the proper direction. (Remember, the left connection on the chip is for +.)

Finally, figure out where the battery holder will sit. The Falcon doesn't have much space available in the front, which is why your wires needed to be so long. Don't place the holder on a chip as that may lead to overheating problems. It may well be useful to wrap the battery and holder in tape so that it can't short out the motherboard. Personally, I removed my Falcon's fan (which only cools the RAM -- it's not needed with my RAM upgrade) and attached the battery holder to the fan mount.

Replace the battery every 5 - 10 years.

Galen

8545. [NEW] KEEPTIME v1.0 System patch when battery of your Real Time Clock is down.

Newsgroup: comp.sys.atari.st
Date: 2006-11-30 23:00:56 UTC
From: DOCs <"docs ifrance.com">
Message-ID: <456f61fc$0$19650$426a34cc@news.free.fr>
Source record: 6772

Friday, December 1st 2006,

KEEPTIME v1.0 is a patch to disable a system time reset when the battery of your RTC is dead. This text has been written for the Atari Falcon. It may be applied to Falcon, TT and compatibles.

The Problems

"My Falcon losts the time and date when I switch off."
(15/31/07 0:00 for each boot)
"My Falcon boots in low resolution."
"My TOS is always in English and the keyboard is Qwerty."

The Explanation

Whenever you are shutting down your Falcon, the time,the date and NVRAM settings are saved into the RTC chip (Real Time Clock).
The Real Time Clock can also be named 'CMOS Clock' or 'CMOS Battery'.
The RTC contains a 128 bytes memory to save setup information.
The approximative life length of this chip is about 10-12 years because the RTC contains a built-in battery. The Falcon is not a very young machine, so the battery of your RTC is now dead !!

This chip soldered on the Falcon motherboard (U64) is a Dallas DS1287. It can be replaced by unsoldering with the same chip or equivalent (ST MK48T87B-24, MC146818A, MCCS146818BM) . The Dallas DS1287 is, in fact, a DS1285 which a lithium battery has been included in the same block. So you can also break the shell of the RTC to find the built-in battery.
Then, you must disconnect the circuit of the battery and redirect it to a new external battery added. You can find infos about this process on Atari forums on the web or inside ST Magazine.(issue 141)

Unfortunally, you don't want to open your Falcon and replace the RTC chip because you think you are not able to do this !

The Solution

First of all, a good solution is to launch the classic accessory Control Panel to set the time and date for each boot of the machine.

Yes, it's a safe solution but there is a problem !

If you are using TOS or MagiC operating systems, when you quit a program, a time and date reset occurs ! No problem, if you are using Mint OS.
I think it is a little bit irritating to work with that !

It is due to the specific XBIOS Function Gettime(). This same function can be found on TOS versions 3.xx (TT) and 4.xx (Falcon).

This function is called by the system when you return to desktop after closing an application.(I don't know why...)

The Gettime() function has a special behavior when it finds that the battery of the RTC is dead, this function simply resets the time and date!
The dead battery information is sent by the RTC itself.

KEEPTIME is a patch to disable in TOS the time reset by Gettime() function if the battery of your RTC is dead.

http://doyeuxyvan.free.fr/keeptime/v1.0/

You must run it in the AUTO folder.

Caution: To take effect, the TOS must be found in RAM !
Basically, the Falcon works with the TOS located in ROM.
Therefore, the TOS in ROM must be copied in RAM.

So you can use the excellent free tool by Uwe Seimet called ROMSPEED:
http://www.seimet.de/files/atari/romspd31.zip
http://doyeuxyvan.free.fr/keeptime/v1.0/romspd31/
You have just to run ROMSPEED.PRG in the AUTO folder before KEEPTIME.PRG.
In this case, you must know that the MMU is used by ROMSPEED to remap TOS in memory. KEEPTIME takes into account this functionality to locate the TOS.

Under MagiC operating system, the same function Gettime() as the TOS is present. However, you don't need to run ROMSPEED because MagiC is already loaded in RAM.

Copy in this order ROMSPEED.PRG and then KEEPTIME.PRG in your AUTO folder (Generally C:\AUTO). Be sure that your XCONTROL.ACC file is present in the root directory. (Or any kind of another tool to set time and date)

"Thanks, time and date reset has been disabled as long as my Falcon is powered on, but I'm still booting in low resolution with wrong keyboard configuration..."

Yes, it remains the NVRAM configuration problem.
You can find different tools to set up keyboard, TOS language, etc.
But you can only reboot your Falcon if you want that parameters take effect.

I have selected NVRam by Centek:
http://centek.free.fr/atari/softs/nvram.zip
http://doyeuxyvan.free.fr/keeptime/v1.0/nvram/
With this tool you can, of course, configure the NVRAM (into the RTC chip). In addition, you can write a bootable program on a floppy disk which writes your selected configuration into NVRAM chip for every Falcon boot.

Be sure that your floppy disk is present in the drive of course !

Follow this process to create a bootable floppy disk with NVRam:
- Run NVRAM.APP from the desktop.
- Set keyboard and TOS language, time format, boot resolution, ...
- Click on the floppy disk icon and insert a floppy disk in drive A.
- Click on the left icon (NVRAM -> Floppy Disk) in the new window opened.
The program quickly writes the boot sector program on the disk with your
NVRAM Settings.
- Then quit NVRam application. Your floppy disk is good.
(If you click on the NVRAM icon for quit, the settings are saved on NVRAM
chip, but to take effect you must reboot. So, you can perform inifinte
reboots with your good parameters until you switch off your Falcon.)

At each boot, NVRam bootable program looks for if it has been already
installed in memory. In the case of NVRam already installed, the NVRAM
config is not written.

So be careful when you have just switched off your Falcon, the memory and
the RTC are not cleared instantly because it may remains residual current in
the components. I advise to wait a long minute.

The End

Here is my summary procedure to work with a dead RTC battery:
- Switch on the Falcon with the correct floppy disk in drive.
- Very quickly, the floppy disk boot program will be read (You can read on
the screen NVRam flag) and a system reset will occur.
- Now your Falcon boots with the correct NVRAM settings.
- After comes ROMSPEED and KEEPTIME loading.
- On the desktop, it remains to set the correct time and date in the Control
Panel.
- That's all! Good Luck!

Yvan Doyeux

Well done that man. Personally I will be changing the chip when it is time, but a good interim solution it is;-)

Thats great!
I want to have one.

The SD card will make it effectively a exchangeable HD?

Source record: 6775

Thanks for all the advice! Well what I did is I cleaned them with an abrasive eraser (ball point pen style) and then I removed and painted all of the TOS chip legs with "rear window defogger repair kit" (a metallic copper colored conductive paint), and put them back in last night. This morning it was very cold in the room, but the STe powered up with no problem! Of course, I thought I solved the problem before by just cleaning the legs last year and a few months later it started acting up again, so I will update in about 6 months. If no problem by then, then maybe I found a good fix for this problem! -STcomp

PS i think there are hairline crack problems on motherboards a lot, i had another ST that died last year and it has that sort of problem, but I think my STe is purely a socketed chip issue

Take Note v.2.05 MonoChrome/v.1.1 Color; Take Note Software; Ear Training for Musicians.; (2) Disks, 48 page Manual & Box.....$10.00 U.S.

8550. FALCON + CD ROM + Daynaport

Newsgroup: comp.sys.atari.st
Date: 2006-12-01 09:17:32 UTC
From: mail@markgoossens.be
Message-ID: <1164964652.550719.103600@80g2000cwy.googlegroups.com>
Source record: 6777

Hello,

On my Falcon I've a SCSI/Link-3 (model DP0802) daynaport network adapter. Running with HDDRIVER 7.52, Sting 1.26 and the drivers from anodynesoftware (ver0.71)

Last week I attached a Yamaha scsi CD-ROM. I Use metados, with spin. I tried also the drivers for a Falcon. (Falcon.bos).

When I disconnect the daynaport, I get proper access to the CD -ROM. When I disconnect the CD-ROM, I can use without problems the dyanaport.

When they are all connected in a chain, the computer always crashes at start-up. I've tried a lot of combinations in my auto folder, but everything fails. Is this normal ?

The chain is as follows :
First Harddisk drive : scsi id 0, cd rom scsi id 1, syquest ezdrive scsi id 2, as last daynaport scsi id 3, with termination on. No IDE drive installed

I think the sting driver is conflicting with the metados. But I don't know how to resolve it.

If somebody has the same problems, let me know please.

Regards,

Mark

Hi Maurice and Mark,

Thanks Maurice :-)

Mark. It *should* work with a Mega STE as device 1 assuming the internal
host board is enabled. It will be an external device to plug into the ACSI
port. I have a MSTE here to test with, which it will be eventually :-)

Hey Henk!! :-)

This is what I'm working on at the moment. All of the failsafe error checking and that stuff. It's being tested with no less that eight SD cards during development.

Regarding this hot-swapping HD. That's something I'm doing at the moment too. It won't be possible to hot-swap without a reset of the ST (or I don't think it will be). But it will be entirely possible to have a few cards at hand. The ST won't know!! :-)

There will a 1Gb limit. This is afterall a totally standard ACSI hard drive as far as the ST is concerned. That's been the purpose throughout, to present something to the ST that it doesn't see as non-standard. It's no good if it requires fiddly drivers.

When these things eventually ship they'll boot immiediately as I'll supply them with a prepared card, likely 512MB depending on how much I can get them for. Also a standard wall-wart adapter will be required to power it. It requires about 9VDC at 250mA tops.

EVERYTHING is being done by the book. There's no hacking of the ACSI port to soak it's power supply from the data lines (that's possible!!) and the ACSI port will be buffered. Design corners can be cut but I don't want to. :-) This may take a while longer.

I was thinking the way my ZIP drive works on my TT (TOS 3.06)
I can replace a medium and just press ESC.
Well, actually, just the same as a floppy.

> But it will be entirely possible to have a few cards at
> hand. The ST won't know!! :-)

Of course :-)

> There will a 1Gb limit.

People have lost any sense of amounts these days.

I have had a math teacher who explained large mumbers like this:

Take a piece of millimeter raster paper of 1 square meter.
Use a pencil and turn it into a very large checker board.
How long will it take?

Well, its December, and that means we're giving stuff away for the Christmas season!

First up, our usual 3 month subscription to ST Magazine.

Next, we're giving away an Atari Mega STe motherboard!

Last, but not least, is an Atari 8bit game, Guderian.

Our winner for November 2006 is Sauron - he won the 3 month subscription to ST Magazine!

I've decided that I need more specific information about what users want, when it comes to our monthly prize giveaway. So there is a new menu option from the mainmenu. It's "M" for Monthly Prizes. Users who wish to register for our monthly prize giveaways should pick this option and choose whatever prize they are interested in. Your choices will be registered to a logfile that I can check at the end of the month. Users can register for as many prizes as they want, but please only register -1- choice per item, per call. You can register multiple prizes in one call... Thank you all! :)

Congratulations to our winner, and good luck to everyone on this months prizes! :)

You could have implemented an ICD-compatible adapter, without such a limit.

Mmmm, maybe. I've read several times that the *vital* statistics of the disks are only loaded once. But the references haven't followed spec more than once so we'll have to wait and see.

>
> People have lost any sense of amounts these days.

My partner has no clue what file sizes mean. You can say to him, a 100KB .jpg file and it means nothing in terms of size.

To have computers today with 200GB is just ridiculous. It's all bloatware and slapped together. Computers in their original form of using the hardware efficiantly just don't exist anymore. Actually, the Sony Playstations could be a good example of where it does, everything is generated mathematically.

Hi Jimmie,

Chris and I are talking about that at the moment. We're upto about £50 in parts alone at cost price. The chip for example is £15 a throw, running at 40MIPS. Being able to process at 25nS per instruction is essential in the handshaking of the ACSI port, the hardware simply times out if you don't respond within 250nS. nS=nanoSeconds.

It comes down to cost. Namely that I'm not spending hundreds of hours perfecting an addition to the working code. And that 21-bit numbers are just about managable on a 16-bit processor.

The SD cards have a physical limit of 4GB. They are also byte rather than block allocated. I can generate a 32-bit byte sector address from a 21-bit number in 100nS. If I was working with 32-bit block addresses, to convert them to 40-bit byte addresses would take significantly longer, which the SD card couldn't manage anyhow.

If someone was willing to pay £200-£300 for the unit reflecting time and costs (I don't think they would) then I would build it. This has been debated recently on one of the other Atari forums where they're complaining how expensive hardware developments are for the ST. If they were selling by the 10,000 then yes, things would be cheaper. But we're producing for a specialist market. Software is relatively easy to produce as you're working within a fixed system and don't require lab test equipment costing £10,000, as in a 100Mhz logic analyser, a digital storage oscilloscope etc. Hardware on the other hand is full of pitfalls. If you don't get it right electrically, then it doesn't matter if your code is the best code that was ever written.

And how many people produce Software for the ST? Very few. You're one of them so credit goes to you. But there are plenty of people that just like the idea of dreaming and talking about what could be done, citing end requirements without any consideration for how they're going to get there. There's a word for them; bullshit artists. This is the Internet, there's plenty to choose from. This is why I've been quiet for so long. I quietly sit back and do what I do. Anyone offering suggestions is a distraction from the task at hand.

Hardware has the potential to kill an ST outright. I simply don't have the time or money to absorb those costs.

If. If the ICD standard was open source and fully documented then maybe. But it isn't, so rather than spend hours performing R&D trying to reverse engineer an ICD interface (which I don't have, and is subject to copyright anyway), I do what I can. And I do it well. I may be able to implement the additional SCSI commands, but if I can't test them to the 9th degree then I can't sell something. I'd rather be making stuff that works and selling it, than clearing up behind myself in support because I-didn't-think-of-that.

I'm not in a position to test an ICD implementation for every eventuality. And users do eventually find out every eventuality and focus on it. WeST will work as it says it will on the box, and on that note I'll quietly disappear again and get on with it.

Aly

8570. Is there a utility for formatting custom Atari ST floppies on PC?

Newsgroup: comp.sys.atari.st
Date: 2006-12-02 18:13:28 UTC
From: STcomp@cwo.com
Message-ID: <1165083208.464500.278840@80g2000cwy.googlegroups.com>
Source record: 6797

I have been trying to format disks in order to copy .st files on to them, to play games on my Atari STe. In the old days I used to use my Falcon 030 for formatting say, 81 tracks, 10 tracks a sector, etc, then I would simply use Dcopy to copy the .st file into a real Atari ST disk, and my PC could flawlessly read any format I used. Well, sadly I got rid of my Falcon last year for financial reasons :((i did keep my Falcon hard drives for when I get another Falcon someday) and now I am trying to use Fcopy Pro on my STe to format the disks, but my PC will not recognize the boot sector! I guess the PC likes Falcon custom formatted floppies, but not custom formats done on the STe.

I can use MSDOS mode on Fcopy pro, but only for 720K format, and 90% of .st disk images use larger formats with more tracks and or sectors.

Is there a program, either on the ST side or the PC side, that will allow me to choose sector and track numbers for formatting a floppy which is readable to Dcopy (on my PC), so that I can start making disks to use on my Atari STe again? Thanks in advance for any advice you can give me. -STcomp

The things I do on a ST only need about 20 Mb.

If I want to do more, I use a modern computer.

Henk Robbers wrote:

> The things I do on a ST only need about 20 Mb.

The things YOU do, but others have other needs.

Anyway, it was said that supporting more than 1 GB would cause problems
for the ST because it was non-standard and fiddly drivers were needed.
For more than 15 years external Link-compatible adapters have been
working perfectly and the ST does not see these adapters as
non-standard, as claimed. The ST does not see these adapters at all,
only the driver software does. As far as the drivers are concerned every
major driver supports the Link, which means that there are at least 4
established drivers. Looking at the major drivers AHDI is the only one
not supporting the Link.

There may be reasons not to support more than 1 GB, but the ST's
hardware or the drivers have never been a problem.

Hi,

The <http://eureka.atari.org/MacAranym.zip> configuration was updated.
ARAnyM means "ATARI Running on Any Machine" <http://aranym.org/> is
the Virtual Machine that also runs hosted by MacOSX.

ARAnyM is GNU/GPL. The package built by myself is ready to launch.

The version is "Universal Binary". The performances are the same on
PPC and Intel machines.

MacAranym was updated with a 0.9.4beta2 and a recent and 040 optimized
version of the fVDI graphic driver. Redraws will be faster.

Enjoy it :)

Best ATARIan regards,

Hello,

> Is SCSI arbitration turned on in HDriver software? Just a thought.

Yep, it is turned on.

Roger Burrows, the author of the ExtenDOS, told me :

| > When they are all connected in a chain, the computer always crash
at start-up.
| > I've tried a lot of combinations in my auto folder, but everything
fails. Is
| > this normal ?
|
| I don't know if this is 'normal', but unless spin uses the scsidrv
interface,
| it's not surprising. The Daynaport driver needs to talk to the SCSI
bus from a
| timer interrupt and if there is other i/o going on, this will
undoubtedly cause
| a crash of some kind. "

He's a really good guy :). always helpfull.

I want to know if somebody uses the same set-up as me, with succes ?

I think things are a bit more complicated. I am not sure anymore if SPIN! uses the XHDI interface to access devices, but I think so. Provided that SPIN! exclusively uses XHDI calls and provided HDDRIVER 8 is used there should be no potential for a crash. HDDRIVER 8 (but not 7) routes all XHDI calls through the SCSIDRV layer, which effectively means that XHDI and SCSIDRV calls should not collide.

That sounds like good advice for the Dallas DS12887 chip, but I think most stock Falcons (at least those from Atari) came with the ST MK48T87B RTC chip, for which the DS12887 is a pin-compatible replacement. As another poster has said, it is fairly easy to pop the plastic top off of the MK48T87B
and solder in a new battery, as suggested below; there's a photo on Didier Mequignon's CT60 page showing that done on a CT60 mobo (different board, same problem and same chip) here:

http://perso.orange.fr/didierm/ct60/index-e.htm

Hi Rustynutt,

First, you won't need to solder anything to add a mouse. There is a connector on the board but it will need a short adapter since it is a set of inline pines just above the pci slots at the edge of the board. I dont have the Milan manual to hand.

I had lots of problems getting the 68060 to boot and it was all caused by the original PSU, it didn't ramp-up the voltage fast enough to cause it to boot. I had to try another psu.

My Milan behave oddly without a floppy connected.

I think 1GB is plenty, I used my falcon everyday for years, took me several years to fill a 250MB hard drive. I mean ST programs are really small, most supplied on a couple of floppies tops, apart from mass storage does anyone actually use 1GB ?! 1GB of atari programs is unthinkable, I think my C: drive only comes on about 20MB of programs... well thats just me anyways....

> problems should be solved ?

:-) That's a question I cannot answer because there are so many software packages with low level device access involved. I can only say that with HDDRIVER 7 I am not surprised that there are problems, and that HDDRIVER 8 is prepared to solve them. Whether this works depends on the other software packages, though.

> When I first try the demo, and if it NOT work, can I easily downgrade
> to version 7.52 without losing my info on the scsi HD ?

Yes, you can do that, and this is the best way to test if anything changes with a current version of HDDRIVER. Just install the demo of HDDRIVER 8.1 available on http://www.seimet.de/hddriver_english.html. After running tests you can simply re-install HDDRIVER 7.52.

Hiya,

This utility is due to release with the next issue of the Alive disk magazine (http://alive.atari.org/) Same goes for a clock patch that will disable the annoying reset of clock and date when you go back to the desktop on a F030 with dead battery.

cheers,
Matthias

Do you mean that the switch from PPC to Intel is done without any
damage for you ? That ARAnyM is convenient to be launched on an
actual iMac ? That furthermore you use your Macintosh under ARAnyM
as a development platform, and that it is totally suitable for that
usage ? I'm wondering because I have a dual-G4@1.25GHz, that the
"Universal Binary" version was built by Philipp Donzé, and I can't
fully test it myself.

Many of the older ASCI harddrives used to include a battery backed
clock (eg the Supra drives) and this was a real bonus for the ST/STe.

Any chance of adding a clock to one of these cards?

Cheers

Ian.

A great project although I question the choice of name.
If the author isn't into occultism/satanism as the following page
claims (http://joo.kie.sk/satandisk/index.html), why the name, and the
internal project name of "IDE devil"? Whatever the website says it
clearly tells us what's on the developer's mind.

Surely, with some imagination something other than "SatanDisk" could be
made from "SD".

Really? I am fairly new to ST stuff, so forgive the basic question, but
how would I access/set this clock? I have a SupraDrive 30MB hooked up and
working, so I guess then that I would have the clock...

thanks

thanks

Some of the SupraDrives had a Dallas clock chip on the ACSI <> SCSI
driver board. It wasnt always used - I have a drive with the chip and
one without.

There is a utility which you can place in the AUTO folder which reads
the clock and sets the system clock after booting the drive. You can
also set the time.

Cheers

Ian.

If there's an ASCI port, there's no reason why not.

Also, see at the end of the news page there:
http://joo.kie.sk/satandisk/news.html

It says the SD interface hasn't been tested with any STE or MegaSTE (thus
implying that it could well work).

I don't have an Intel mac yet, I'm making the change next year. At the
moment I'm using a G4 mini @ 1.67Ghz and I can't say
that Aranym is lightning fast, but I only use it with a basic MiNT
environment for compiling with Lattice.

May I suggest you to load <http://eureka.atari.org/MacAranym.zip>
again, and to modify the "~/Aranym_files/config" file like :

```
[OPENGL]
Enabled = Yes
Filtered = No

[NATFEATS]
CDROM = sdl
Vdi = opengl
```

So that hardware OpenGL VDI display is enabled. You may experiment
a dramatic acceleration of MacAranym.

I'm interested too but don't let it get disproportionately expensive.
I use my STf 4Mb very rarely these days, but hate having too Floppy
swap - even with resettable RAM disks, its all fiddly. A HDD would be
useful. I have looked at the laptop HDD install options, but still too
expensive - even having the HDDs on hand.

If you could sell without the RAM card as well at a reduced price that
might help. I have some spare SD cards anyway...

I'll certainly have one if too if cost effective and well under the
ï¿½50 ceiling.

In the thread reference was made to a ZIP drive being used. Can a
standard parallel 100Mb Zip be connected to a STf??

This works a lot better. There is something seriously wrong with the other (non OpenGL) natfeat-graphics code when running on Intel Macs.

Unfortunately, the CPU emulation is still dog slow on my machine. JIT or no JIT.

regards

Hmm, I already had those options enabled. I tried the universal app, and it seemed a little quicker, but then I remembered that I overclocked my Mac mini from 1.42 to 1.67Ghz a couple of days ago, (I hadn't ran aranym since), and the machine is noticabley quicker all round. So I fired up the PPC (non universal 0.9.4) but it still looks the same speed.

Ho ... I understand, thanks. The thing that happened in between, was
that Philipp Donzé corrected an important bug with the OpenGL display.

That's why I suggested you to load MacAranym once again.

That should be no problem - the PCI bios was specifically designed to handle
shared interrupts, and the drivers should be able to handle that as well.

The bootblock will assign the available interrupts to the PCI cards, so
unless you need lots of interrupts for ISA cards, you can assign more
interrupts to PCI using MSETUP, this should make it possible to have
separate interrupts for each card, which will give a lower interrupt latency
(although the gain it is probably too small to notice).

>the specific SCSI card, I'd assumed that was because it was the

The driver used to be for sale, but since I don't have time to support it,
it is free now. It is still locked to a specific Milan board, because I did
not yetget around to compile a version without that check.

If you send me your milan serial number by mail, I can prepare a driver for
you.

Sure, if we buy 1,000 of everything then we can push prices right down. while a lot of SD cards have been tested , some are really slow to others. Alison has done much testing with this and it even surprised me on how slow some of the things are. From out point of view, if we do not supply the cards and then you find its really slow, what is going to be your reaction ? It is very difficult to decide what's best in terms of price and keeping people happy. I am not going to go off on a rant about prices again, though if you take the time involved to do the programming, say 6 months, a few weeks of PCB development and time, PCB fabrication costs, buying all the parts, you can easily hit £10,000 figure in 6months. We give the time as a gift already, you can see how much it costs us to produce kit. It will cost around £50 figure to manufacture each board fully. We are giving the time as a gift and we sure are not going to loose out on supplying free parts.

When used hard kit is going for around £100 even for 200MB drives, then double that price would be a reasonable figure for a new bit of kit with 1GB space, much faster also.. much smaller. We know very few people are going to pay £200 for them, though we are not going to let it cost us to produce them. I've produced electronics kit for people for years, everyone seems to think its a couple of weeks job to design and test something. I have many ongoing projects, one project is 11months old, the other is almost 3 years in development.

Take something simple, get yourself a 8 bit PIC micro, a programmer, get all the software and manuals, then sit down and write a program to flash 8 lights in "knight rider fashion"... see how many weeks/months it takes, then develop a PCB for it and get a professional company to produce them in low qty. see how much it costs in time and cash just to do that simple thing.... once you have done all that, then get yourself a logic analyzer and start to reverse engineer Atari's hard drive protocols with very little information to go on. If its not something you can do yourself then pay someone £100 a hour to do it.. if you can't write the code then get them to design and program the thing also at £100 a hour.

I wish people would understand that it costs a hell of a lot to develop kit. This is why people buy cheap stuff from overseas these days, they think £20 for a new TV is a reasonable price, then they complain as it explodes 2 months after they buy it. We are not in the cheap and nasty market. We are

serious developers and we will not produce anything until we are 100% happy with it. We won't put slapdash products onto the market. We could sell 1,000 of the things for £20 , none of them will probably work right, but who cares ? people have the thing and its cheap nothing else matters right ? well while most think like that, we would rather sell 10 items and have them 100% perfect on the market. I would rather have 10 happy customers than 1,000 people sending me abuse as the items do not work right. I'd be a rich man with all the cash I collected, though with all the time in sorting out problems it wouldn't be worth the time..

So, nope its not going to be under 50quid. In fact the price has not been set at all yet. Normally we price items on how much it costs to produce in parts and add a few quid on for time for postage etc. I was explaing postage to a customer the other days, posting parts off to the manufacture, them posting it all back, then I have to post the stuff off to him.. it totalled a massive £80 in total. Split that between 10 items and your up to £8 already and nothing has even been costed in yet. if 1,000 items sold then that price for postage would be next to nothing, though as we are dealing in low figures it seriously adds to cost.

cost effective is just the nice way of saying cheap and nasty. Something which we will not do. anyway, going off on a rant again, I think this type of thing should be added into the Atari FAQ somewhere. Its getting daft to keep explaining to people how much stuff actually costs to develop. I'll say it to everyone, go kit your own little workshop out with all the equipment to develop such things and see how much it costs you to get started. let alone development of products.

Chris

That's me.
I use a 100Mb SCSI ZIP drive on my TT.
The question was whether Alisons SD/HD could behave the same as a ZIP
in general.

As far as I know the ST's parallel port lacks the ability to read
data from it.

Not very exciting :-(. Faster than a floppy, but a lot slower than
almost any hard disk I've seen on the Atari. But it *is* relatively
cheap, so as usual you gets what you pays for ...

From a number of things you've said & I've spotted on the web, I'm guessing you're using a dsPIC33FJxxx device. If you're not, please ignore the following :-).

I checked my Digi-Key catalog & for qty 25, prices run from around $9.00 cdn to $23.00 cdn each, including shipping & taxes, depending on chip features. At current exchange rates, that's around 4 to 10 pounds each. Even if you're using the most expensive version, you still seem to be paying over the odds ...

I was reading up on cards on the web & discovered that counterfeiting is
quite a problem (counterfeits are often slower, what a surprise). I
think you're right that it makes sense to offer your drive with an SD
card included to avoid surprises. Of course, many people would like
more space, and/or a backup, and so they'll be planning to buy extra
cards themselves anyway. Do you plan to provide any kind of list of
suggested/approved/recommended SD cards?

Hey everyone - don't forget about the weekly Atari chat tonight. Official gathering time is 8:00pm CST, and you have 3 options for getting in:

- Use your favorite IRC client to connect to irc.newnet.net and join channel #atari.

- Telnet from your 8-bit or other machine to irc.atarichat.net (216.37.55.109) and login as "atari". This will get you into the chat without the need for an actual IRC client.

- Use the Java applet found at http://www.newnet.net.

If you can't make it around 8:00 tonight, or if you would like to stop in other times, feel free to drop in anytime. There are generally a few lurkers hanging around, so you may catch some good coversation at any random visit.

We haven't yet decided 100% on what device to use, digi-key do have good prices, though when you just want a couple of devices to try the local store has to do. If we buy 25 pcs sure price will be a lot lower. though we will have to have 25 payments upfront before we do that. chances are will have to buy just a couple at a time to save us from having lots of them until the end of time... its never easy unfortunalty.

8625. Analogue Controller technology development

Newsgroup: comp.sys.atari.st
Date: 2006-12-07 14:34:00 UTC
From: Stephen Moss <sgm23@eng.cam.ac.uk>
Message-ID: <el98ji$l88$1@gemini.csx.cam.ac.uk>
Source record: 6602

For those who do not frequent Atari Age I have announced the technology development (not production) of a new Bankswitching analogue controller for the Jaguar based on a converted PlayStation controller, as the STE and Falcon have compatible enhanced joystick ports I though some of the folks here may also find it of interest. You can find the topic at http://www.atariage.com/forums/index.php?showtopic=98138 or go directly to the webpage at http://sgmelectrosoft.co.uk/hardware/gamepad.htm for more information and a draft technical reference.

I don't know what disks you've seen, but "back in the day" when I used a
ICD Link with Quantum and Seagate disks (50-200Mb disks) with my STs I got
little more than 105-110Mb/s.

This must be a typo. With my first Seagate drive (Megafile 30, RLL) and
a standard ST the transfer rate was roughly 450 KB/s. With SCSI drives
by Quantum etc. the ST is capable of transferring about 1300 KB/s, the
TT about 1800 KB/s.

My dear, I guess that speed is not even available in the internal
registers of the MC68000 :)

The TT could handle such speed, somehwere in the 1st level cache.

Otherwise it's more the speed of an U160 or U320 controller, reading
out of the HDD-Cache ;-)

Best regards,

Daniel Mandic

8629. [ANN] DEditor 1.0

Newsgroup: comp.sys.atari.st
Date: 2006-12-08 09:41:24 UTC
From: Pierre TON-THAT <geek@atarians.com>
Message-ID: <45793344$0$21145$7a628cd7@news.club-internet.fr>
Source record: 6606

Bonjour

Deditor is the dungeon editor for DGEM.
Works on every Atari since 640*400*16c and a modern OS (MagiC advised)

Download on my homepage or directly at http://rajah.atari.org/files/
- dedi100.zip (150 KB)

Snapshot at http://rajah.atari.org/images/snapshots/deditor_snap.png

DGEM 1.0 is finished and it will be released probably tomorrow or
sunday. Please give me time to build an example of a dungeon.
The purpose of DEditor is for you to create and propose new adventures.

As a reminder, DGEM is a dungeon Master clone, running under GEM
environement, with lastest Ataris OS or enhanced emulators.
Better have enough RAM (TTRAM managed) and a modern OS such as MagiC.

You can already download:
- ddoc100_fr.zip (23 KB, french guides)
- ddev100.zip (450 KB, GFA sources)

Snapshot http://rajah.atari.org/images/snapshots/dgem_snap.png

The game uses the old graphics, so you'd better have one of the original
disks of Dungeon Master or Chaos Strikes Back.

Please wait for the next release...

Message-ID: <457a9e5e$0$21146$7a628cd7@news.club-internet.fr>
Source record: 6608

Bonjour :)

The Dungeon Master clone for GEM (latest machines or enhanced emulators
for Ataris) is now complete.

Download on my homepage or directly at http://rajah.atari.org/files/
-> dgem100.zip (1.8 KB, 8MB unzipped)

News:
- missiles: thrown objects, spells casting, etherical effects
- last remaining spells
- Chaos' death
- wall items: amalgam, exit, dagger thrower, fireball or venom generators
- trigger for alcoves: activates something if put/remove precise object.
- some bugfixes

Apologizes for the 'thin' labyrinth, but I had no inspiration. Please
feel free to edit it, geek it, build your own adventure and propose it
to others.

The program is now yours. Hope you'll enjoy.

I suppose I have forgotten some bugs, so there will be some fixes from
time to time. If you have suggestions, they are welcomed, but please
wait a little time and give me a little period of rest.

Voilï¿½!

>In the thread reference was made to a ZIP drive being used. Can a
>standard parallel 100Mb Zip be connected to a STf??

As I understand it, no. The Atari parallel interface lacks some of
the connections and facilities for reading signals from the device
to the computer that a full parallel port should have. Only the
SCSI version of the ZIP-drive works on Ataris, via a Link or
similar ACSI>SCSI adaptor.

Hi Peter!

X>Only the SCSI version of the ZIP-drive works on Ataris, via a Link or
X>similar ACSI>SCSI adaptor.

IDE(ATAPI) ZIP-drives will work also, either natively on IDE ports (e.g. on the
Falcon or Milan) or via SCSI2IDE bridge adaptor on an SCSI bus.

You're understanding of this stuff is obviously a lot better than mine.
I'm just a db and software monkey.

> A photo of it would be nice to get the brain working.

I've just pulled this Milan part to take a photo with my newly borrowed
digicam. I've don't have a CF card reader so it will take a few days
to be able to send you the image. There isn't a lot to see (to my eyes)
and it has a heatsink and fan attached. The fan isn't needed.

>The whole idea behind buying the Milan board was the 060 upgrade. I hate

The PSU I fitted was older and grottier than the one in the Milan
tower but it worked with the 060.

The driver is flashed onto the bootblock and is specific to the serial
number but you've probably figured that out all ready.

>First and foremost is getting the Milan to boot the 060. I have a
>feeling that learning that curve will aid in getting the Afterburner
>to boot with the 060 as well, and open up Expose, NOVA, Apex and
>hopefully a slew of Falcon specific applications that are not
>compatible with the CT card. It's a cool dream anyway :)
>
>Any advice you have on the adapter would be appreciated, and I'm
>really lost as to modifying the Milan set up. Michael said earlier
>that it looks all current, so don't think that is an issue at this
>point.

At boot it should bleep and flash the keyboard leds (like it does
with the 040). I think it will do that even with the 040 TOS/bootblock.

>Sorry for being long winded. No one else to talk to about it :)

Mine is more reliable with Mint (1-15-12) than it is with TOS and
is more compatible. This is with both 040 and 060.

I was never able to get the scsi card to work with clock speeds
above 25/50MHz but that is the least of your worries at the moment
but it might be worth dropping back to 25MHz for the time being.

If I can help with anything just ask, I'm more than happy to pass
on what little I know.

Peter

While we are on the subject of Milan accelerating, are there any other ways of getting more speed out of one ?

I have the 060 and ATI graphics card but things ahve moved on since the Milan was designed and I wondered if there are any new tricks that could be applied.

I think Ingo once mentioned adding adding DMA support. Can the bus be accelerated ?

Unfortunately, Windows XP doesn't seem to let you choose tracks and sectors except for the standard 720 k format. That is kind of why I was wondering if there was a utility either on the Atari to format MS-DOS compatible floppies with extra sectors and tracks (as soon as you add extra sectors or tracks with F-Copy Pro on the ST side, the PC doesn't like to read the disks anymore) , or maybe there is some other command to format extra tracks under the MS-DOS prompt, but so far if I change sectors or tracks by even one extra in the XP DOS Prompt, the PC seems unable to format a floppy disk. :P Too bad since most of the games worth playing on my real STe require me to be able to format the floppy ahead of time with extra tracks, so that I can use DCOPY on my PC to write the actual ST disk. I really wish I still had my Falcon, that always worked beautifully for formatting in anyconfiguration of tracks I wanted and still be able to read on my PC! (in FCOPY pro the MSDOS compatible box wouldnt grey out on my Falcon when i added tracks past 79, but on the STe there is only an MSDOS compatible option when I use standard 720 formatting)

yes it does.

click on START
click on RUN
type in "CMD" - press enter
type in "format /?"

someone else even asked the same question a few weeks ago and I even
uploaded a batch file example. I have been using XP for a few years now
formating all kinda of floppy formats.

if it won't let you format higher sector counts then your chances are your floppy drive does not support them. I am amazed by how naff floppy drives are today, anything over total generic format and they refuse to work. get yourself a sony MPF series drive and be sure it will work correctly.

8643. Atari 1040 ST disc problems

Newsgroup: comp.sys.atari.st
Date: 2006-12-11 16:00:37 UTC
From: Douglas C White <douglas@WPI.EDU>
Message-ID: <Pine.LNX.4.64.0612111056400.31207@CCC5.WPI.EDU>
Source record: 6620

I've got a 1040 ST that I was using with MAstertracks Pro. The disc drive developed problems and I replaced it with a Chinon or TI drive. I have lately been trying to save my midi files and I am finding on discs with more than one song the songs are gone! There are song listings but they won't open up.

I suspect that I am the victim of the floppy drive problem where it will write to disc when you don't want it to?
Is there a way to reclaim these files?

thanks,

-doug

To ask a silly question, is the disk full ? I've had music programs appear
to save files when the disk is full but it only writes the name of the file
to floppy, of course it can;t write any data as the disk is full... might be
worth a quick check before taking your ST apart.

This is probably the problem. ST drives used to have a disk change line.
Later ones don't. I think you need to press "Escape" to tell the ST to
re-read the directory, or to force a write. I think there used to be an auto
folder utility to solve this...

Deutsche Version unten. (German version below.)

I have an Atari SM 124 black and white monitor (220V) which I don't need anymore. It works fine; you just need to supply a standard PC power cable. If anyone would like it, it's yours for the cost of postage from 23717 (Germany). Inside Germany, that's 6.90 Euro. It can also be picked up from the town of Sagau (near Eutin); obviously then there would be no postage cost either. If interested, please email sm124 at ryandesign dot com quickly; my aunt doesn't want it taking up space anymore and will throw it away soon otherwise.

Ich habe einen Atari SM 124 schwarzwei Bildschirm (220V) zu verschenken; ich brauche ihn nicht mehr. Er funktioniert einwandfrei; Sie ben tigen nur ein normales PC Stromkabel. Sie k nnen den Bildschirm haben wenn Sie die Portokosten von 23717 (Deutschland) bezahlen; innerhalb Deutschland w re das 6.90 Euro. Sie k nnen den Bildschirm gerne auch im Dorf Sagau (in der N he von Eutin) abholen; dann entfallen nat rlich auch die Versandkosten. Wer sich interessiert sollte schnellstm glich eine E-Mail an sm124 at ryandesign punkt com schicken; der Bildschirm nimmt meiner Tante Platz weg und sie wird ihn sonnst wegwerfen.

-Ryan

Hi Chris!

But does XP then read the non-standard floppy? Becasuse I can't get
my son's PC to read 82-track 10 sector floppies formatted on the
Falcon, for instance. Or is there a command-line trick for this as
well?

Regards, /Peter/

If you have to format floppies on the PC if you want to read them on the Falcon. It won't work the other way unless you write a MSDOS boot sector to the floppy. persoanlly I never got that feature to work.

XP is a bit naff on floppy access,there is a program which will write floppy images (MSA) back onto a floppy to read on the Atari, though the PC will not read it as its a Atari disk. If you want to read a disc on both machines, then you will have to format it on the PC. If you are wanting to transfer files from Falcon to PC, just use normal 1.44 floppies formated on the PC... not exactly sure what you are trying to do....

atari holiday sale, buy three, get one free.

offer good till january 1st, 2007.
buy any three titles off of any of our new in the box list of games
for your atari(any atari machine listed, mix or match machines), and
receive a new in the box game from the list below, free. there will be
no substitutions, only what is listed on the free list.

atari 400/800/xl/xe new disk games that qualify for the free game
offer,
arcade II,
adventure pak,
conflict in vietnam,
crusade in europe,
decision in the desert,
dig dug,
f-15 strike eagle,
greatest hits one,
gateway to apshia,
jumpman jr.,
pitstop,
pole position,
space games,
strategy simulations,
superman,
summer games,
silent service.

atari 400/800/xl/xe new cartridge game list that qualify for the free
game offer.
necromancer,
pacman(cart only),
super breakout,
tennis,
alphabet zoo,
delta drawing,
space journey.

or receive a new in the box cx-80 atari trackball for the atari
models, 2600,7800, 400/800/xl/xe computers/st/tt/falcon 030 computers.

some quantities may be limited. prices subject to change without
notice. no substitutions for the free game allowed, only what is
listed.
you must by three titles on the same order to qualify for the free
game offer.

you can qualify for more than one free offer by doubling, or tripling,
etc. your order.
we take paypal, or all major credit cards.
otherwise please visit our website at,
www.atarisales.com click on the ordering information page for more
payment options.

thanks,
lance
www.atarisales.com

we also have these in stock right now,

we have a small quantity of the game tapper in stock on a xe super
cart board in the ribbed sided cart case.
price, $29.95.
we still have these, only in smaller quantities now,
we only have a few now of these titles left in stock in a xe super cart

shell
with the ribbed side case. they are $29.95 a piece. first come, first
served.
bruce lee,
commando,
hard hat mack,
mean 18 golf,
midi maze,
vanguard.

we have a very limited quantity now of these titles in a xe super cart
shell
with the handle on the back. they are $29.95 a piece. first come, first

served.
bruce lee,
commando,
deflector,
mean 18 golf,
midi maze,
tower toppler

we take paypal, all major credit cards, or please visit our web site

8657. [ANN] Studio Son 2.091 beta FR & UK

Newsgroup: comp.sys.atari.st
Date: 2006-12-14 23:00:32 UTC
From: DOCs <"docs ifrance.com">
Message-ID: <4581d798$0$8225$426a34cc@news.free.fr>
Source record: 6634

Friday, December 15th 2006,

This new release is the result of six months of irregular but always intense work. The audio editor for Atari Falcon becomes more and more stable and reliable with this 2.091 beta version. Many bugs of general use have been fixed.

Studio Son 2.091b is available in the wonderful french language:
http://doyeuxyvan.free.fr/studioson/std2091b/STD2091F.ZIP

BUT Studio Son is back in English !
http://doyeuxyvan.free.fr/studioson/std2091b/STD2091E.ZIP

You can, of course, find the classic 68030 and 68030+68882 versions in these archives.

I have performed a lot of hard tests to check the quality of my algorithms. I have written a lot of different DSP and C programs to obtain correct results. But, it is still a beta version, so be careful with your samples !

This version has been tested with an original Falcon 030 with a 68882 coprocessor. The CT60 card is not officially supported.

Bugs fixed:

- Crashs when filtering under Magic fixed.
- For a resample process under Magic, internal file management fixed.
- Significative noise reduction of plopping sounds as long as you use Studio Son.
- Management improved of AIFF files compatible with Cubase Audio. These files are now saved with a physical size rounded to 1024 bytes multiples. Useful to prevent crackling noise when you import your AIFF files with Cubase Audio.
- Buggy "Scrub" function rewritten. No crash occurs.
- Reverse stereo bug for a "Scrub" fixed but still in beta test mode.
- Buggy "Cross Fade" function improved. Autocorrection for wrong parameters. The UNDO is also correct.
- Cut, Copy, Paste, Insert and others have their UNDO bugs fixed.
- Bug of the current working folder fixed. (After an Insert for example)
- DSP effect after a Resample and Filtering is now restored with no problem.
- Overall settings saving are now re-enabled ! Up to date, you MUST keep the STUDIO.SYS folder.
- Rewritten "New Sound File" function. You can now create a file with the fileselector, choose a frequency, ...
- Rewritten "Apply Effect" function. Sample gap subtly fixed. Due to the DSP

real time application of this function, it is obvious that it remains a very small gap into your final sample. This gap is usually filled by zero values as it has been thought for this rewritten function.
- Markers management bugs fixed. (Delete, saving and loading procedures)
- There was play error with "Preview Cut" function. It's now okay.
- Block selection with SHIFT+TAB to the next marker has been debugged.
- Sample time length is now updated after any UNDO.
- Little bug fixed during a play actived by the space bar with an exported sample from Studio Son.
- Many another minor bugs.

New features and bugs fixed:
(since 2.09b version)

- Resampling function added (Linear Interpolation).
- Resampling function includes a filter and linear interpolation code in only one DSP program.
- You can resample from 2 Khz to192 Khz.
- WAV files opening issue fixed.
- Huge undo bug fixed.
- Huge bug of the volume of mono samples filtered fixed.
- FIR filters (Low Pass, High Pass, Band Pass and Band Reject) up to 2048 coeefficients.
- Resample process can be followed by a LowPass filter up to 1024 coefficients.
- DSP Filter algorithm improved. The speed of the treatment have been increased. Now you can enjoy a good optimization of the filtering process.
- The end of the sample is now truly filtered.
- Vu meter clipping problems fixed.
- The cursor running is now correct when sample frequency is not the same as the system frequency.
- Desktop background pattern modified to improve the work in monochrome.
- Redraw bug of the desktop in monochrome corrected.
- Several dialog boxes fields bugs fixed in monochrome.
- Crashs at very high zoom levels fixed.
- You can now really select all the sample with the mouse.
- You can now really place the cursor at the end of the sample with the mouse.
- Wrong size of the blocks at the end of the sample corrected.
- You can now create a block with a "one sample" size when you make a long click on a part of the sample.
- New alert boxes for the Filtering and Resampling function.
- New internal undo for the Resampling function.

New function "Resample..." allows you to change the frequency of your samples with a linear interpolation and an optional Low Pass filter.
The "Filtering..." function enables you to carry out FIR filters (Low Pass, High Pass, Band Pass and Band Reject).
This is performed by the DSP 56001 and with Direct to Disk process.

```
-------------
Known bugs:
-------------

- Several internal DSP effects can sometimes result in a reverse stereo
mode, take care of this.
- No sound when playing very high frequency samples.
- Slowly WAV files opening.
- Selected block after a resampling task is not deleted.
- Sample duration and time counter are wrong when the system frequency
doesn't match with the sample frequency.
- You can hear some noise when playing WAV files at fast speeds.
- Unable to reduce physically the size of a sample when you cut blocks.
- Make an undo after the "Replace" function have no effect.
- A lot of useful alert boxes need to be added.
- In the time counter, the value 99 is followed by 10.
- Several little bugs into the sample window.
- The icon of the function "Generate Low Frequencies" differs with the
colour of the resolution.
- Little bugs of sample drawing.
- Random error messages when filter steepness is very low.
- It might remain some english translation errors.

If you are using Studio Son on a single TOS, I strongly recommend the launch
of ARROWFIX.PRG in the AUTO folder:
http://doyeuxyvan.free.fr/studioson/std2091b/arrfix15/

If you are using NVDI, just run ARROWFIX.PRG after this.
Otherwise, GEM must be copied in RAM with the program GEMRAM.PRG before
running ARROWFIX.PRG:
http://doyeuxyvan.free.fr/studioson/std2091b/GEMRAM16/

If you have troubles to run Studio Son under Magic, you can use the patch
DSPSLOW1.PRG by Centek included into the package or you can find it here:
http://doyeuxyvan.free.fr/studioson/std2091b/DSPSLOW1.PRG
Don't run DSPSLOW1.PRG if you launch Studio Son under TOS otherwise you
might have display or DSP locked issues.

You can also use the nice DSPXBIOS patch by Didier Mequignon:
http://perso.wanadoo.fr/didierm/files/dspxbios.zip
http://doyeuxyvan.free.fr/studioson/std2091b/dspxbios.zip

If you use an external clock, run FDI_INIT.PRG into the AUTO folder:
http://doyeuxyvan.free.fr/studioson/std2091b/FDI_INIT.PRG

FPATCH2.PRG is now included in the package.

You can also download self-extracting STZIP unpacker:
http://doyeuxyvan.free.fr/stzip26/STZIP26.TOS

Have fun !

Yvan Doyeux

And Happy 80th Birthday Granny !
```

8661. ARAnyM 3D Pack

Newsgroup: comp.sys.atari.st
Date: 2006-12-15 20:46:30 UTC
From: Francois LE COAT <lecoat@atari.org>
Message-ID: <458309A6.9000600@atari.org>
Source record: 6638

Hi,

You may be interested in the following 0.9.4beta2 ARAnyM version
<http://aranym.org/>. Very latest devels have been taken into account.

- The Pack_3D at <http://ebmodel3.atari.org/Pack_3D/> that runs on 3
OS/platforms including Windows, Linux and MacOSX.

It contains ARAnyM 0.9.4beta2 version accelerated with OpenGL VDI
display and

EmuTOS dated from 2006/02/20
FreeMiNT+XaAES from 2006/09/23
TERADESK 3.86
EB MODEL3 3.62a (only available in this pack)
EB_DUMP 0.9.7
BOXKITE 2.32e
EUREKA 2.12 beta from 2006/09/09 (only available in this pack)
QED 5.0.5
POV 3.1g
ZVIEW beta 7
ZTASK 1.0
MESA_GL 0.93 (derived from Mesa3D 2.6)
CAB 1.5
HIGHWIRE 0.3.0
HYP_VIEW 0.35.2e
TWOINONE 1.51
INTERFACE 2.30
TWILIGHT 2.08
COPS 1.07
TOSWIN 2.6
PAULANG 0.2b

ready to start with.

- The minimum pack <http://eureka.atari.org/MacAranym.zip> that is built
for MacOSX, Universal Binary (x86&PPC).

Enjoy :)

For those of you with whom I had such a great time chatting Wednesday (or
was it Tuesday?) afternoon / evening, know ye that I DID TRY to get in for
the Thursday chat last night, but wasn't able to. My Opera-web-browser's
"chat" facility -- which turns out to be an IRC client -- sat in
"Connecting..." for about two hours and NEVER DID actually connect.
Dang. Any speculation on whether the problem is at MY end or the OTHER?

This won't stop me from continuing to try, but whatever's going on MIGHT
continue stopping me from SUCCEEDING. :-(

C.

8663. Atari Disk Drive Step Rate

Newsgroup: comp.sys.atari.st
Date: 2006-12-16 01:36:31 UTC
From: phantomm <phantomm@bellsouth.net>
Message-ID: <t4Igh.62$AY1.58@bignews5.bellsouth.net>
Source record: 6640

It may seem a silly question, but what should the Step Rate be
set to for the internal 1.44 disk drive in the Atari Falcon?

(I believe it's 6, but not sure.)

Also, would this be the same on all internal and external 1.44
Atari disk drives such as in the Mega STE?

And does any copy protection make use of the Step Rate
in the protection?

Apex Media has some weird copy protection on the disks
before they are registered and am curious if anyone knows
how to back it up?
Reason is I had one set of disks get damaged during setup.
And I think it may be due to the wrong Step Rate set, as
the drive went nuts with the installation disk.
Seems fine on other original disks.

I'd hate to mess up this other original Apex, by using the
wrong backup system. The Apex Manual warns of
damage to the disks if trying to back them up.
But I don't see how.... As long as they are not
written to.

I have another original Apex set, that I'd like to backup, before setting up
just in case.

Any ideas?

Not sure but:
every 3"1/2 disk drive has a step rate of 3ms.
old external 5"1/4 disk drive ahd a 6ms step rate. (useful for PC
emulation with old software)

Guillaume.

Step rate is just the wait time between the head moving from one track to another. Its meant to give the head time to settle before reading/writing. The step rate is set by a byte in the bootsector. The legal values for this I believe are 2,3,6 and maybe 12ms. I think 6 and 12 are used on 5.25" drives. Good 3.5" drives can be set to 2ms no problem. On not so good drives, or drives that are nearly 20 years old! - if the step rate is set too small, then you risk not being able to read that disk properly again. You could use a sector editor to change the step rate to a higher value (I recommend only 3ms - and dont do this on a disk with a bootable bootsector!) and then try reading it again.

Step rate has nothing to do with copy protection. If you backed up the disks with a sector copier (like FCOPY) then apart from the information thats in the sector gaps, the disks will be identical, including the step rate. If you tried copying the disks with GEM or dragging the

files across to disk B... well you know that would be daft ;-)

If your original media got damaged then maybe either your floppy drive is dodgy, or the apex is doing something strange because of the Mega STe hardware. Don't forget - a lot of ST games failed on the new STe computers when they came out, one of the reasons was hardware (like the shifter) differences, but many also because the copy protections failed.

8666. Re: Atari Disk Drive Step Rate

I seem to remember with Apex you had to register the program on the disk
and then you could back it up as normal, I seem to remember trying to
back it up before I registered and it damaged the disk as has happened
with yours..

Very easy? That is not what I hear (unless you are very good with a
soldering iron)

I know for me to remove a socket involves cutting off each leg and just
unsoldering the pins out. I am not very good and soldering but this does
the trick...

what???? REALLY??????

8693. [ANN] Anodyne Software web site update

Newsgroup: comp.sys.atari.st
Date: 2006-12-21 04:30:43 UTC
From: Roger Burrows <sergeantvimes@yahoo.ca>
Message-ID: <t82ko25knp3frmqr7uhmoibknerttdfl6l@4ax.com>
Source record: 6520

The Anodyne Software web site has been updated, as follows:

ExtenDOS 4 version 4.05 is now available. It fixes problems in CD.BOS, CDaudio and ExtInfo, and increases compatibility with some drives with buggy firmware. A patch to update previous versions to version 4.05 is available from the web page at:
http://www.anodynesoftware.com/e4/updates.htm

A note has been added concerning a minor problem with CDwriter; see the CD Writer Suite web page at:
http://www.anodynesoftware.com/cdws4/support.htm

If you are in the habit of accessing the alternate web site rather than the main one, please note that the alternate has been moved to:
http://www.magma.ca/~anodyne

8699. Sexiest game for the AMIGA???

Newsgroup: comp.sys.atari.st
Date: 2006-12-23 03:36:23 UTC
From: Ed Zagmoon <spartan_isle@yahoo.com>
Message-ID: <1166844983.156314.82590@48g2000cwx.googlegroups.com>
Source record: 6526

Unlike the crappy ATARI ST, the AMIGA was able to create
really sexy sprites, e.g. a girl looked like a girl on the AMIGA
while it looked like a blocky something on the ST.

So which is the sexiest, most erotic game for the AMIGA???

From: vdjole@EUnet.yu
Message-ID: <emj6lf$u2h$2@news.eunet.yu>
Source record: 6529

Hi;

What would be the politically correct way to treat the sizes
of directory objects that can be retrieved in some filesystems?
Should thay be displayed and counted/summed or should they be ignored?

I am not referring to the summary sizes of items -in- a directory,
but to the sizes of the objects with the directory attributes and
information themselves.

Original Atari desktop ignores them but some desktops and iirc some file-
selectors display them. What would be 'proper' ? (I am more inclined to
ignoring them, as I do not see that they are useful information).

cu;

Djordje Vukovic <vdjole@EUnet.yu> schrieb :

> What would be 'proper' ?

I think jinnee does it right: let the user choose, if he wants to see the sizes or not. Sometimes I need the foldersizes e.g. for burning CDs. But on big partitions with lots of files it takes much time to add the sizes of a directory and its children.

Gruï¿½,
Karsten

I just received a Mega STE. The 1.44 Floppy drive is not working. I have been searching for one. And I understand that its a Epson Smd-340. I have searched for this on ebay and came up with a large list. But I am not sure if any of then will work beause they all have differnt numbers after the 340. Anyone know where I can get one or if you look on ebay will any of those work. Also it needs a keyboard. Anyone know where I can get one?

I think Djordje means if teradesk should show the size of directory
entries itself -- i.e. not the content of directory but how much space
it takes on filesystem (i.e. 4 KB) if you create new directory. Maybe
I'm wrong :) But in this case I choose ignoring them...

Wow, Dordrecht. I never thought I would see that name in an Atari group. One of our satellite offices is there at the company that I have worked at, and i have been there a few times.

I know this is off topic, but I couldn't not respond...

Geoff

I don't think Jos is still reading Atari newsgroups.

You'd better ask this in the Dutch Atari mailing list.
atari-nederland@yahoogroups.com
Jos post there from time to time.

Doei,

Martin

I see on a few Modula-2 related sites that TDI Modula-2/ST is available
for download. However, the URLs provided are no longer active. Doea
anyone know of a valid source? For those helpful types, I know about
Megamax Modula-2, and have it, thanks :)

Terry

David,

I see some visits to my site from CAB and Highwire. Would those be from you? I'm wondering if the site displayed ok. I've tried to keep my sites straight HTML over the years, specifically to allow all browsers equal access, however, I recently started using a CMS called Joomla, and I don't know how well it will display in Atari browsers.

Terry,

Yes I did try, and neither Highwire nor CAB had any luck. Highwire
reported 'header timeout' and CAB just kept waiting.

Ugh... that's too bad. I'm going to need to work around that. I don't
have much that is Atari related on the site at the moment, however, the
site should be accessible by everyone, just on general principles.

The development version of HighWire displays the site just fine. So this
is being fixed to everybody's satisfaction :-)

Cheers,
JFL

David,

Only obvious difference seems to be with stik/mintnet

au Australia mozilla 4.0 (compatible; atari highwire/0.3.1 stik2)
2006-12-28 03:04:23
be Belgium mozilla 4.0 (compatible; atari highwire/0.3.1 mintnet)
2006-12-27 09:52:29

I think that's it, then. I just tried with HighWire 0.3.0 (MiNTnet), and
although the display seems a tad less conformant than 0.3.1, it's OK.

Cheers,
Jef

On the off chance that Dan reads this and thinks that it's his fault,
I should point out that I'm running MagicNet, not STik2.

What ovl module do you use, then? MiNTnet.ovl?

Cheers,
Jef

Well, technically, if someone is at fault, it is me, since it's my site.

OK. I thought Magicnet was MiNTnet-compatible. I must have been
mistaken, then.

Cheers,
JF

Hallo Jean-Franï¿½ois!

JFL>OK. I thought Magicnet was MiNTnet-compatible.

It is, but not fully and may be a little outdated. MiNTNet-versions of commandline tools like CVS and WGET do work, but the Cab or highwire MiNT-Net overlays don't. For Cab, there's a recompiled Overlay available.

In general it is, or was, but MiNTnet has moved on a bit. mintnet.ovl
works with Magicnet, but I use other things that need GlueStik

I'm in the long slow process of cleaning out my basement. So far I only have gone through a small portion of the items but enough to start posting it for sale / trade. I put a Web Site together and started posting items to it. I do have a large selection of hardware available but not much is on the site at the moment. I'm hoping in the next 30-60 days to start really get things rolling on the site. The URL to the site is listed below.

Classic Computer and Video Game items for Sale/Trade
http://fmhcentral.freeservers.com
